

Revised Final Draft

July 2007

CENTRAL AND SOUTHERN FLORIDA PROJECT

COMPREHENSIVE EVERGLADES RESTORATION PLAN

Programmatic Regulations

Six Program-Wide Guidance Memoranda

**U.S. Army Corps of Engineers
Jacksonville District**

**South Florida Water
Management District**

TABLE OF CONTENTS

INTRODUCTION.....	1
Comprehensive Everglades Restoration Plan	1
Goals and Purposes of the Plan.....	1
The programmatic regulations	2
Integrated Framework for Assuring the Goals and Purposes of the Plan are Achieved.....	2
Guidance Memoranda.....	3
Guidance memoranda Development and Approval Process.....	5
Organization of this Document.....	7
Revisions to the Guidance Memoranda	7
Relationship with Other federal or State Guidance	7
Flexibility in Implementing Guidance memoranda	8
SECTION 1: Guidance Memorandum #1 Project Implementation Reports.....	1-1
1.1 Purpose.....	1-1
1.2 Applicability	1-1
1.3 Role of the Project Delivery Team	1-1
1.4 Project Implementation Reports	1-1
1.5 Seeking Improvements to The Comprehensive Plan	1-4
1.6 Elevation of Issues	1-4
1.7 In-Progress Reviews and Other Meetings.....	1-4
1.8 Coordination with RECOVER.....	1-6
1.9 Plan selection	1-7
1.10 Real Estate Considerations	1-7
1.11 Information to Address Requirements of Florida Law	1-9
1.12 Crediting of Non-Federal Sponsor Construction	1-9
1.13 External Peer Review.....	1-9
1.14 Features to Improve Water Quality.....	10
1.15 Project Monitoring Plan.....	1-10
1.16 Compliance with Fish and Wildlife Coordination Act (FWCA).....	1-11
1.17 Compliance with Endangered Species Act (ESA).....	1-11
1.18 Consultation with Tribes.....	1-12
1.19 consideration of Recreation opportunities	1-12
1.20 Regional Modeling Analyses.....	1-13
1.21 Determining Hydrologic Connections and Spatial Extent of Project Effects.....	1-19
1.22 Updating the comprehensive plan.....	1-19
1.23 Major PIR Activities	1-19
1.24 Format and Content of PIRs	1-23
Attachment 1-A Determining Hydrologic Connections and Spatial Extent of Project Effects.....	1-A-1
Attachment 1-B Overview of Major PIR Activities.....	1-B-1
Attachment 1-C Project Implementation Report Outline	1-C-1
SECTION 2: Guidance Memorandum #2 Formulation and Evaluation of Alternatives For Project Implementation Reports	2-1
2.1 Purpose.....	2-1

2.2	Applicability	2-1
2.3	Updating Goals, Problems and Opportunities, and planning Objectives and Constraints	2-1
2.4	Performance Measures.....	2-2
2.5	Period of Analysis.....	2-4
2.6	Consideration of availability of pre-cerp baseline water and Existing Water Reservations or Allocations	2-5
2.7	Screen Alternative Plans for Effects on Existing legal sources of water and Levels of Service for Flood Protection.....	2-5
2.8	Considering Changes to Operations Outside of the Project Area.....	2-6
2.9	Trade-Off Analysis	2-6
2.10	Risk and Uncertainty Analysis.....	2-6
2.11	Formulation and Evaluation for the pir.....	2-6
SECTION 3: Guidance Memorandum #3 Savings Clause Requirements		3-1
3.1	Purpose.....	3-1
3.2	Applicability	3-1
3.3	Savings Clause	3-2
3.4	Definition of Existing Legal Source	3-3
3.5	Relationship of Savings Clause to Other Required Analyses	3-3
3.6	Legal Entitlements	3-4
3.7	The Pre-CERP Baseline.....	3-6
3.8	Intervening Non-CERP Activities	3-8
3.9	Model Selection for Savings Clause analyses	3-9
3.10	Identifying if There Is an Elimination or Transfer of Existing legal sources of water	3-10
3.11	Determining if Levels of Service for Flood Protection Have Been Reduced.....	3-14
3.12	Documentation of Guidance Memorandum #3 Analyses.....	3-18
Attachment 3-A Other Analyses and Protections for the Natural System		3-A-1
Attachment 3-B Other Analyses and Protections for Other Water-Related Needs ..		3-B-1
Attachment 3-C Other Analyses of Flood Protection to be Conducted in Addition to the Savings Clause.....		3-C-1
Attachment 3-D Procedure for Minimum Deliveries to Everglades National Park Water Accounting.....		3-D-1
Attachment 3-E Effect of Intervening Non-CERP Activities on Existing legal sources of water.....		3-E-1
Attachment 3-F Effect of Intervening Non-CERP Activities on Reduction in Levels of Service for Flood Protection		3-F-1
Attachment 3-G Water Basins.....		3-G-1
Attachment 3-H Flow Chart for Elimination or Transfer Test.....		3-H-1
Attachment 3-I Checklist for Levels of Service for Flood Protection		3-I-1
SECTION 4: Guidance Memorandum #4 Identifying Water Made Available for the Natural System and for Other Water-Related Needs.....		4-1
4.1	Purpose.....	4-1
4.2	Applicability	4-1
4.3	Legal Framework for Identifying Water.....	4-1
4.4	Project Improvements In Water Quality	4-2

4.5	Key Concepts For Identifying Water	4-2
4.6	Identifying Water	4-5
4.7	Identifying water to be reserved or allocated for the natural system	4-16
4.8	Assurance Language For The PIR	4-17
4.9	Future Changes to Water to be Reserved or Allocated.....	4-17
4.10	Documentation of Guidance Memorandum #4 analyses in the PIR.....	4-18
Attachment 4-A CERP Assurance of Project Benefits Agreement (President-Governor Agreement)		4-A-1
Attachment 4-B State Tools For Providing Assurances.....		4-B-1
Attachment 4-C Model Language for Assurances Section of the PIR.....		4-C-1
SECTION 5: Guidance Memorandum #5 Operating Manuals.....		5-1
5.1	Purpose.....	5-1
5.2	Applicability	5-1
5.3	Operating Manuals.....	5-1
5.4	General Guidance for Preparation of Operating Manuals	5-4
5.5	Phasing of Project Operating Manuals	5-8
5.6	Development of the System Operating Manual.....	5-11
Attachment 5-A Format and Content of Project Operating Manuals.....		5-A-1
Attachment 5-B Format and Content of the System Operating Manual		5-B-1
Attachment 5-C Guidelines and Examples for Operating Manual Content for Water Quality Certification Assurances.....		5-C-1
Attachment 5-D Examples of Operational Schematics and Figures.....		5-D-1
SECTION 6: Guidance Memorandum #6 AssesSment Activities For Adaptive Management		6-1
6.1	Purpose.....	6-1
6.2	Applicability	6-1
6.3	Adaptive Management	6-2
6.4	Assessment Activities	6-7
6.5	Guidance for the Conduct of Assessment Activities of RECOVER	6-10
6.6	Technical Assessment Reporting Framework	6-16
6.7	Peer Review of Assessment Documents.....	6-20
Attachment 6-A MINIMUM REPORTING GUIDANCE.....		6-A-1
APPENDIX A DEFINITIONS.....		A-1
APPENDIX B Acronym List.....		B-1
APPENDIX C List of References		C-1
APPENDIX D Letters of Concurrence		D-1

INTRODUCTION

COMPREHENSIVE EVERGLADES RESTORATION PLAN

First authorized by Congress in 1948, the Central and Southern Florida (C&SF) Project provides the South Florida ecosystem with flood control, regional water supply, prevention of saltwater intrusion, preservation of fish and wildlife, recreation, and navigation. In fulfilling these objectives, the project has had unintended adverse effects on the natural environment that constitutes the Everglades and South Florida ecosystem. As a result, in 2000 Congress authorized the Comprehensive Everglades Restoration Plan (CERP) or “the Plan” to restore, preserve, and protect the South Florida ecosystem while providing for other water-related needs of the region. CERP consists of structural and operational modifications to the C&SF Project and will be implemented over the next 35 years. Together these components are expected to deliver benefits to improve the ecological functioning of over 2.4 million acres of the South Florida ecosystem, improve urban and agricultural water supply, improve deliveries to coastal estuaries, and improve regional water quality conditions, while maintaining the existing levels of flood protection.

GOALS AND PURPOSES OF THE PLAN

The Water Resources Development Act of 2000 (section 601 of WRDA 2000) approved the Plan contained in the “Final Integrated Feasibility Report and Programmatic Environmental Impact Statement” dated April 1, 1999. As stated in section 601(h) of WRDA 2000, “the overarching objective of the Plan is the restoration, preservation, and protection of the South Florida ecosystem while providing for other water-related needs of the region, including flood protection and water supply.” As approved by Congress, the Plan contains 68 major components that anticipate the creation of approximately 217,000 acres of reservoirs and wetland-based water treatment areas, wastewater reuse plants, seepage management, and the removal of levees and canals in natural areas. These components increase storage and water supply for the natural system, as well as for urban and agricultural needs, while continuing to fulfill the original objectives of the existing CS&F Project. The Plan will restore more natural flows of water, including sheetflow; improve water quality; and establish more natural hydroperiods in the South Florida ecosystem. Improvements to fish and wildlife habitat, including those that benefit threatened and endangered species, are expected to occur as a result of the restoration of hydrologic conditions. This will promote the recovery of native flora and fauna, including threatened and endangered species.

Section 601 of WRDA 2000 requires that:

“The Plan shall be implemented to ensure the protection of water quality in, the reduction of the loss of fresh water from, and the improvement of the environment of the South Florida ecosystem and to achieve and maintain the benefits to the natural system and human environment described in the Plan, and required pursuant to this section, for as long as the project is authorized.”

1 **THE PROGRAMMATIC REGULATIONS**

2
3 Section 601 of WRDA 2000 required the Secretary of the Army, with the concurrence of the
4 Secretary of the Interior and the Governor of Florida, and after notice and opportunity for
5 public comment, to promulgate Programmatic Regulations to ensure that the goals and
6 purposes of the Plan are achieved and to establish the processes necessary for implementing
7 the Plan. The final Programmatic Regulations became effective on December 12, 2003 as
8 Title 33, Part 385 of the Code of Federal Regulations (CFR).
9

10 **INTEGRATED FRAMEWORK FOR ASSURING THE GOALS AND**
11 **PURPOSES OF THE PLAN ARE ACHIEVED**

12
13 Section 601(h) of WRDA 2000 and the Programmatic Regulations establish an integrated
14 framework of tools, processes, and an enforcement mechanism for ensuring that the goals
15 and purposes of the Plan are achieved. This framework includes tools for planning,
16 implementation, and evaluation; a process for developing these tools in an open public
17 process, with input from other Federal, Tribal, State, and local agencies; and an enforcement
18 mechanism to ensure that the requirements of the statute are carried out.
19

20 **Tools**

21
22 Section 601 of WRDA 2000 establishes the following tools for ensuring that the goals and
23 purposes of the Plan are achieved:

- 24 • The specific planning tool established by section 601(h) of WRDA 2000 is the
25 Project Implementation Report (PIR).
- 26 • The specific implementation tools established by section 601(h) of WRDA 2000 are
27 Project Cooperation Agreements (PCAs) and Operating Manuals.
- 28 • The specific evaluation tool established by section 601(h) of WRDA 2000 is the
29 interim goals for evaluating the restoration success of the Plan.
- 30 • In addition to the specific planning, implementation, and evaluation tools established
31 by section 601(h) of WRDA 2000, the Programmatic Regulations establish additional
32 tools, including but not limited to, Project Management Plans, Program Management
33 Plans, Comprehensive Plan Modification Reports, the Master Implementation
34 Sequencing Plan (MISP), and interim targets for evaluating progress towards
35 achieving the other water-related needs of the region.
36

37 **Processes**

38
39 The Programmatic Regulations establish the processes for developing these tools. Consistent
40 with section 601(h) of WRDA 2000, the Programmatic Regulations were developed after
41 notice and opportunity for public comment, with the concurrence of the Secretary of the
42 Interior and the Governor, and in consultation with the Seminole Tribe of Florida, the
43 Miccosukee Tribe of Indians of Florida, the Administrator of the Environmental Protection
44 Agency, the Secretary of Commerce, the Florida Department of Environmental Protection,
45 and other Federal, Tribal, State, and local agencies.

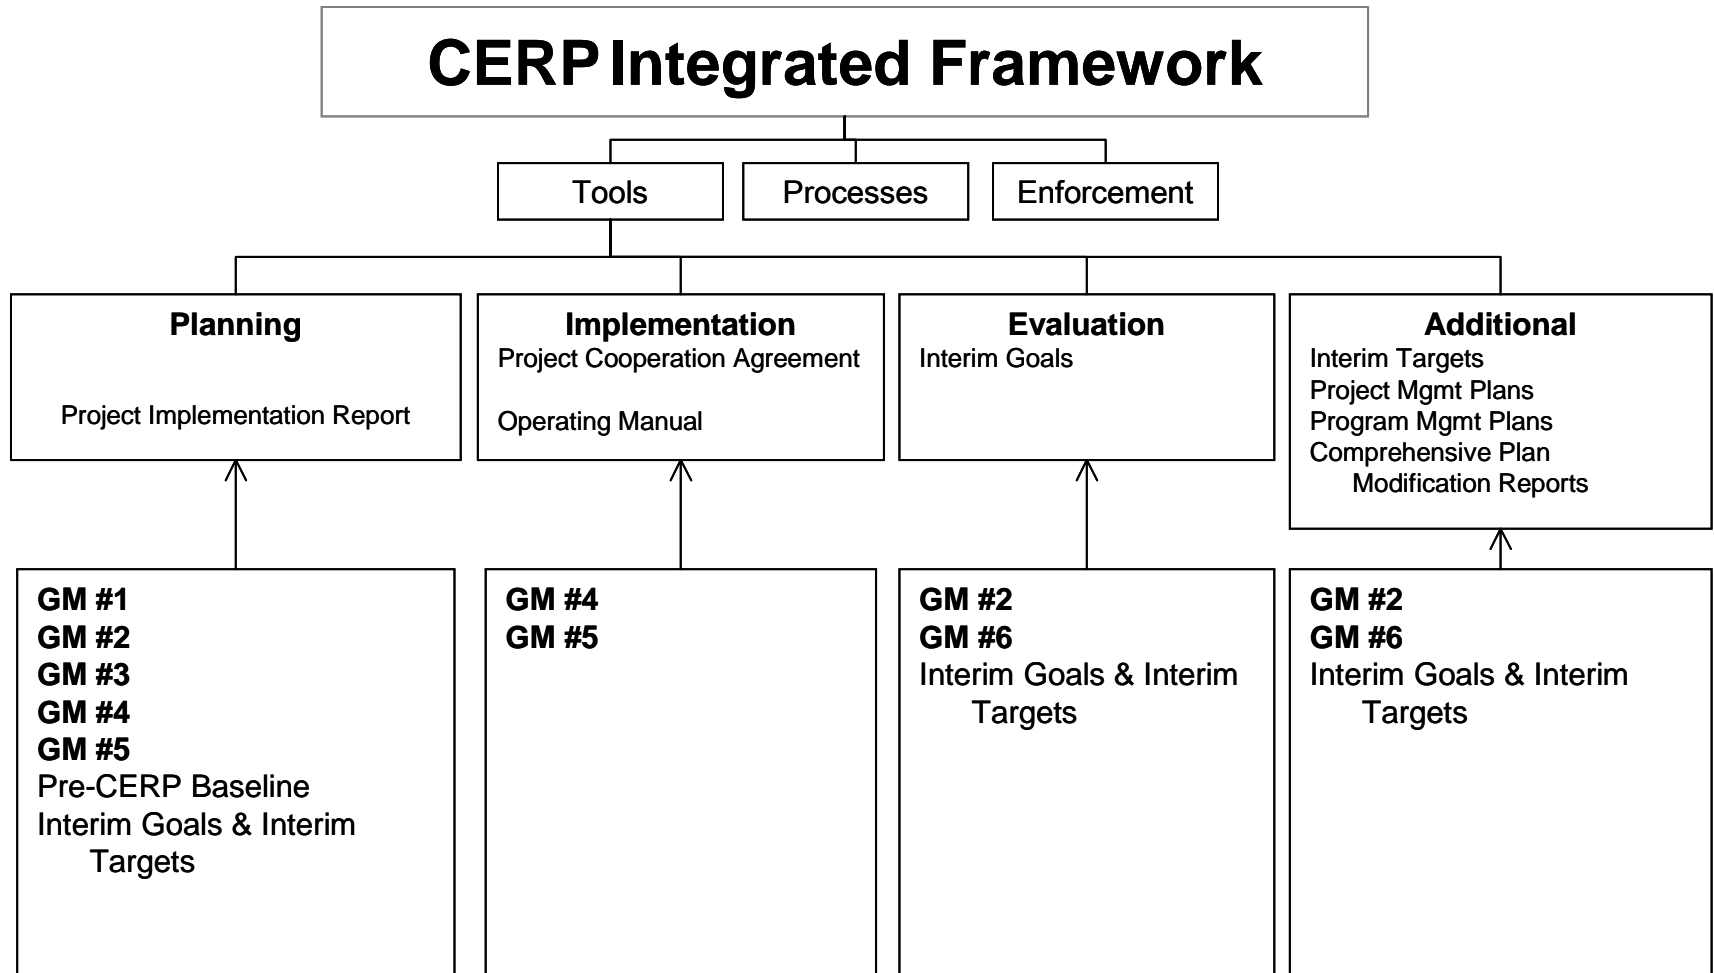

1
2 **Enforcement Mechanism**
3

4 The specific enforcement mechanism established by section 601(h) of WRDA 2000 is the
5 “Comprehensive Everglades Restoration Plan Assurance of Project Benefits Agreement,”
6 dated January 9, 2002, between the President of the United States and the Governor, under
7 which the State will ensure by regulation or other appropriate means, that water made
8 available by each project in the Plan will not be permitted for a consumptive use or otherwise
9 made unavailable by the State until such time as sufficient reservations of water for the
10 restoration of the natural system are made under State law in accordance with the PIR and
11 consistent with the Plan.
12

13 **GUIDANCE MEMORANDA**
14

15 Section 385.5 of the Programmatic Regulations specifically requires the development of six
16 program-wide Guidance Memoranda that are consistent with the Programmatic Regulations
17 and applicable law, and establish additional procedures to achieve the goals and purposes of
18 the Plan. The Guidance Memoranda are fundamental to the integrated framework; provide
19 direction for using the tools for planning, implementation, and evaluation; and provide
20 assurances that the goals and purposes of the Plan will be achieved. Figure A illustrates the
21 interrelationship between the tools and technical guidance used to implement the tools.
22 Figure A also illustrates the interrelationship between each of the Guidance Memoranda as
23 well as with the integrated framework of tools, processes, and enforcement mechanisms.
24 Presenting the six Guidance Memoranda as one complete package also demonstrates how the
25 Guidance Memoranda work in concert to ensure the goals and purposes of the Plan are
26 achieved. The Guidance Memoranda address numerous topics including common methods,
27 general procedures, and guidance to implement the Plan. The six program-wide subjects for
28 the Guidance Memoranda as set forth in the Programmatic Regulations are:

- 29
- 30 • Guidance Memorandum #1: Project Implementation Reports
 - 31 • Guidance Memorandum #2: Formulation and Evaluation of Alternatives for Project
32 Implementation Reports
 - 33 • Guidance Memorandum #3: Savings Clause Requirements
 - 34 • Guidance Memorandum #4: Identifying Water Made Available for the Natural
35 System and for Other Water-Related Needs
 - 36 • Guidance Memorandum #5: Operating Manuals
 - Guidance Memorandum #6: Assessment Activities for Adaptive Management

1
2
3

Figure A: Framework for Assuring Goals and Purposes of the Plan are Achieved

1 **GUIDANCE MEMORANDA DEVELOPMENT AND APPROVAL**
2 **PROCESS**

3
4 Section 385.1 of the Programmatic Regulations requires the Secretary of the Army to
5 ensure that the public understands the linkage among the processes, tools, and
6 enforcement mechanism and to ensure that the Secretary can monitor the effectiveness of
7 this integrated framework in assuring that the goals and purposes of the Plan are achieved
8 by:

- 9 • Providing for public notice and comment in the development of planning,
10 implementation, and evaluation tools;
- 11 • Providing notice of final action on planning, evaluation, and implementation
12 tools;
- 13 • Making available to the public on a web site or by other appropriate means final,
14 and where appropriate, draft copies of all planning, evaluation, and
15 implementation tools; and
- 16 • Explaining through the Programmatic Regulations and by other appropriate
17 means the process for developing the tools, the linkage between the process, tools,
18 and enforcement mechanism, and the means by which these elements constitute
19 an integrated framework for assuring that the goals and purposes of the Plan are
20 achieved.

21
22 Section 385.5(b) of the Programmatic Regulations describes the special processes for the
23 development of the six program-wide Guidance Memoranda. The development process
24 for these Guidance Memoranda was initiated prior to the effective date of the
25 Programmatic Regulations in order to layout a strategy for effectively and efficiently
26 developing the technical work products and to elevate issues for resolution within the
27 prescribed time frame. The Programmatic Regulations require that the US Army Corps of
28 Engineers (USACE) and the South Florida Water Management District (SFWMD)
29 develop, in consultation with the Department of the Interior, the Environmental
30 Protection Agency, the Department of Commerce, the Miccosukee Tribe of Indians of
31 Florida, the Seminole Tribe of Florida, the Florida Department of Environmental
32 Protection, and other Federal, Tribal, State, and local agencies, the six Guidance
33 Memoranda for approval by the Secretary of the Army. Figure B illustrates the Guidance
34 Memoranda development and approval process as required by section 385.5 of the
35 Programmatic Regulations.

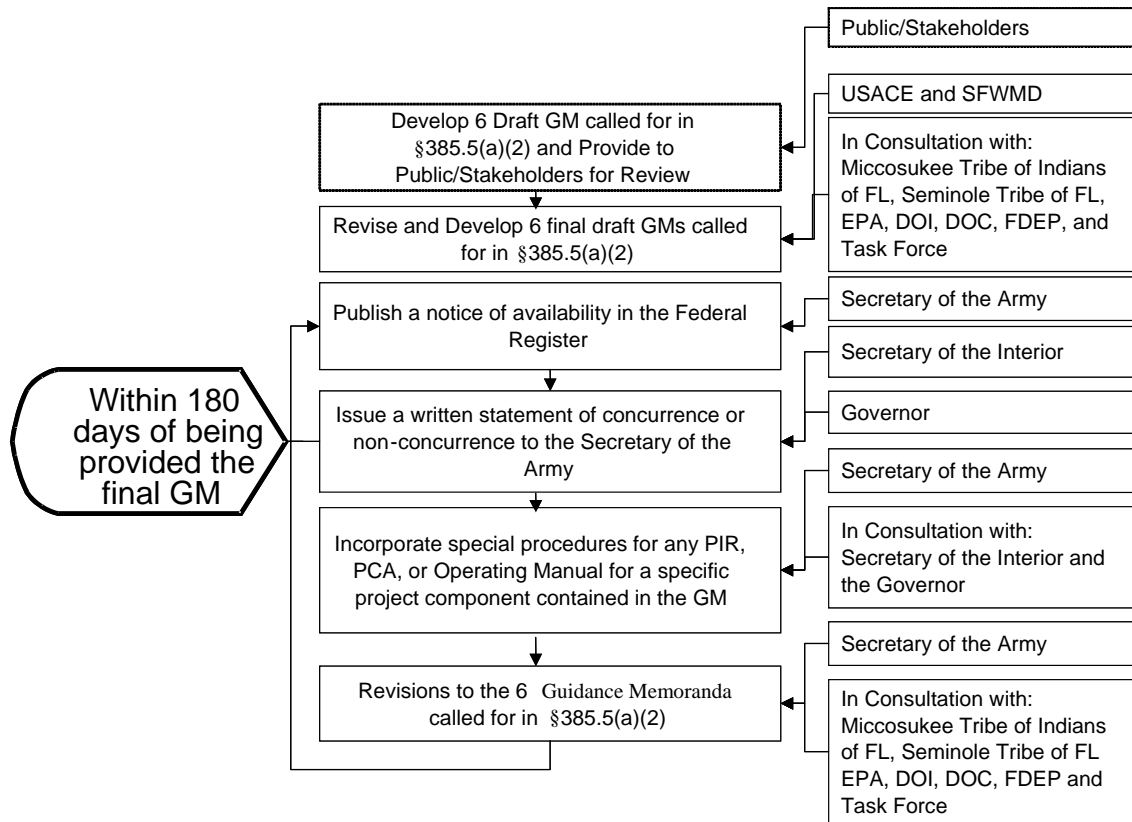

Figure B: Guidance Memoranda Approval Process

The USACE and the SFWMD began the development process by inviting all of the governmental entities that would be consulting on the documents to participate on a team responsible for developing the Guidance Memoranda. This interagency team was then further divided into sub-teams responsible for preparing initial outlines and drafting the documents. This process was designed to be open and inclusive. An initial public meeting was held at SFWMD in West Palm Beach, Florida to invite the public to participate in the process and present the strategy for developing the guidance. Information about the work of the teams (meeting summaries and initial work products) was posted on the CERP website (www.evergladesplan.org). Throughout the yearlong development process briefings were conducted for the SFWMD Water Resources Advisory Commission and the South Florida Ecosystem Restoration Task Force. In October 2004, an In-Progress Review meeting was held with USACE South Atlantic Division and USACEHQ and the Office to the Assistant Secretary of the Army for Civil Works to review the draft work products, resolve issues, and request direction from USACE management.

As part of the consultation process required by the Programmatic Regulations, a draft of this document containing the six Guidance Memoranda was made available for review by agencies and the public in November 2004. The review period for the agencies and the public remained open until January 2005. Meetings were held with stakeholder groups during this period. Consultation meetings were held with the Seminole Tribe of Florida and the Miccosukee Tribe of Indians of Florida. The USACE and the SFWMD also

1 consulted with the South Florida Ecosystem Restoration Task Force at their meetings in
2 December 2004 and January 2005. Comments were received from a number of agencies,
3 stakeholder groups, and individuals. These comments were posted on the CERP web site.
4 The USACE and SFWMD then prepared a final draft of this document containing the
5 Guidance Memoranda.

6
7 In accordance with the Programmatic Regulations, a final draft containing the Guidance
8 Memoranda was submitted to the Secretary of the Army for approval and concurrence by
9 the Secretary of the Interior and the Governor. On May 6, 2005, the Department of the
10 Army placed a Notice of Availability in the Federal Register to indicate the availability of
11 the final draft of the Guidance Memoranda and that public comments would be accepted
12 until June 6, 2005. Following the close of the public comment period, the comments were
13 reviewed and considered. Due to the extensive comments that were received and the
14 concerns that were raised by the public, the May 2005 draft was revised and this revised
15 final draft was prepared for public comment.

16 17 **ORGANIZATION OF THIS DOCUMENT**

18
19 The Guidance Memoranda are fundamental to the integrated framework; provide
20 direction for using the tools for planning, implementation, and evaluation; and provide
21 assurances that the goals and purposes of the Plan will be achieved.

22
23 This document contains the six Guidance Memoranda and is divided into six main
24 sections, one for each of the Guidance Memoranda. Where necessary, technical details
25 that will assist Project Delivery Teams with using the guidance are included at the end of
26 that section as an attachment. This document also contains appendices that include a
27 glossary of terms, a list of acronyms, and a list of references.

28 29 **REVISIONS TO THE GUIDANCE MEMORANDA**

30
31 These Guidance Memoranda are based on the best information available during their
32 development. In accordance with the Programmatic Regulations, the Secretary of the
33 Army may, whenever the Secretary believes it is necessary, and in consultation with the
34 Department of the Interior, the Environmental Protection Agency, the Department of
35 Commerce, the Miccosukee Tribe of Indians of Florida, the Seminole Tribe of Florida,
36 the SFWMD, the Florida Department of Environmental Protection, other Federal, Tribal,
37 State, and local agencies, and the public, revise the Guidance Memoranda. Such revisions
38 will be developed and approved consistent with the process used to develop the Guidance
39 Memoranda document and will require the same concurrence process.

40 41 **RELATIONSHIP WITH OTHER FEDERAL OR STATE GUIDANCE**

42
43 These Guidance Memoranda are intended to supplement existing Federal and State policy
44 guidance. For example, the USACE has numerous Engineering Regulations (ERs) that
45 set forth the requirements for planning and implementation of Federal water resources

1 projects and will be used in conjunction with these Guidance Memoranda to plan and
2 implement projects.

4 **FLEXIBILITY IN IMPLEMENTING GUIDANCE MEMORANDA**

5
6 In accordance with section 385.5(b)(1) of the Programmatic Regulations, the Guidance
7 Memoranda should be consistent with applicable law in accordance with the goals and
8 purposes of the Plan. Should a situation arise in development of a PIR where the
9 procedures set forth in the Guidance Memoranda are in conflict with achieving the goals
10 and purposes of the Plan or applicable law, the Secretary of the Army, Secretary of the
11 Interior and the Governor, or their designees, shall determine whether a special procedure
12 should be utilized in the PIR to address the issue.

1 associated with the implementation of the alternative plans being evaluated, including the
2 “no action” alternative.

3
4 The PIR documents the planning process and all relevant assumptions and rationale for
5 project decision-making. All planning analyses, including economic, environmental, water
6 quality, flood protection, real estate, and plan formulation, conducted during the planning
7 phase are documented and included in the PIR. The PIR includes a full description and
8 analysis of the benefits expected for each alternative plan. The PIR also identifies and
9 quantifies uncertainties regarding the cost or performance of alternative plans or project
10 components as well as impacts to formulation, operations, and performance. These
11 uncertainties are not limited to hydrologic performance of the specific structure component,
12 but also include uncertainties about the expected ecosystem response to the component. In
13 addition, the PIR documents design activities for the selected alternative plan such as
14 modeling, hydraulic design, and real estate.

15
16 In accordance with section 601 of WRDA 2000, all PIRs must accomplish the following:

- 17 • Provide the level of information, documentation, and analysis in addition to that in
18 the “Final Integrated Feasibility Report and Programmatic Environmental Impact
19 Statement” dated April 1, 1999, necessary for the Federal government and the State
20 of Florida to approve CERP projects for authorization.
- 21 • Present the formulation, evaluation, selection, justification, and description of the
22 selected alternative plan.
- 23 • Document the project cost and cost-sharing requirements of the non-Federal sponsor
24 and the USACE, along with their responsibilities for implementation and operation of
25 the project.
- 26 • Link the actions proposed in the subject PIR to the overall system-wide CERP Plan.
- 27 • Fulfill the assurances requirements of section 601 of WRDA 2000 and the
28 Programmatic Regulations.

29
30 While the PIR has many aspects of a USACE feasibility study, the primary difference in
31 these two reports is in the steps taken to complete formulation and evaluation of the project.
32 Unlike a feasibility study, the PIR is based on components that have previously been
33 formulated to a certain level in developing the Plan and are expected to accomplish specific
34 Plan goals. As such, the PIR always begins with the formulation already completed in
35 developing the Plan. In many cases, it is envisioned that the PIR effort will focus on
36 optimization of the project described in the Plan. However, in some cases, formulation of
37 additional alternatives will be needed. Additionally, unlike a feasibility study, the PIR must
38 contain the additional analyses required by section 601 of WRDA 2000 and the
39 Programmatic Regulations.

40 41 **1.4.1 Programmatic Regulations Requirements**

42
43 The Programmatic Regulations (section 385.26) require that each PIR:

- 44 • Be consistent with the Plan and applicable law, policy, and regulation, including
45 the Federal government’s Principles and Guidelines of the Water Resources
46 Council, as modified by section 601(f)(2)(A) of WRDA 2000;

- 1 • Be based on the best available science;
- 2 • Comply with all applicable Federal, State, and Tribal laws;
- 3 • Contain sufficient information for proceeding to final design of the project, such
- 4 as: additional plan formulation and evaluation, environmental and/or economic
- 5 benefits, engineering and design, costs, environmental impacts, real estate
- 6 requirements, and the preparation of the appropriate NEPA documentation;
- 7 • Contain the information necessary to determine that the activity is justified by the
- 8 environmental benefits derived by the South Florida ecosystem in accordance
- 9 with section 601(f)(2)(A) of WRDA 2000 and/or that the benefits of the project
- 10 are commensurate with costs, and that the project is cost-effective;
- 11 • Comply, in accordance with section 601(b)(2)(A)(ii) of WRDA 2000, with
- 12 applicable water quality standards and applicable water quality permitting
- 13 requirements;
- 14 • Identify the appropriate quantity, timing, and distribution of water dedicated and
- 15 managed for the natural system taking into account the availability of Pre-CERP
- 16 Baseline water and previously reserved or allocated water as well as the estimated
- 17 total quantity of water that is necessary for restoration of the natural system and
- 18 the quantity of water anticipated to be made available from future projects;
- 19 • Identify the amount of water to be reserved or allocated for the natural system
- 20 under State law necessary to implement the provisions of sections
- 21 601(h)(4)(A)(iv) and (vi) of WRDA 2000;
- 22 • Identify the quantity, timing, and distribution of water made available for other
- 23 water-related needs of the region;
- 24 • Determine if existing legal sources of water are to be eliminated or transferred;
- 25 • Determine that implementation of the selected alternative will not reduce levels of
- 26 service for flood protection that: (1) were in existence on the date of enactment of
- 27 WRDA 2000; and (2) are in accordance with applicable law; and, as appropriate,
- 28 consider opportunities to provide additional flood protection;
- 29 • Include an assessment of the monetary and non-monetary benefits and costs,
- 30 optimization and justification, cost-effectiveness, and engineering feasibility of
- 31 the project;
- 32 • Include a discussion of any significant changes in cost or scope of the project
- 33 from that presented in the “Final Integrated Feasibility Report and Programmatic
- 34 Environmental Impact Statement,” dated April 1, 1999;
- 35 • Include an analysis, prepared by Restoration Coordination and Verification
- 36 (RECOVER) of the project’s contributions towards achieving the goals and
- 37 purposes of the Plan, including, as appropriate, suggestions for improving the
- 38 performance of the alternative plans;
- 39 • Describe how the project contributes to the achievement of interim goals and
- 40 interim targets;
- 41 • Include a Draft Project Operating Manual (POM) as an appendix; and
- 42 • Include, as appropriate, information necessary for the non-Federal sponsor to
- 43 address the requirements of Chapter 373 of the Florida Statutes (F.S.), and other
- 44 applicable planning and reporting requirements of Florida law.
- 45

1 **1.4.2 Level of Detail for Project Implementation Reports**

2
3 The level of detail contained in a PIR should be commensurate with the complexity and cost
4 of the project while including the information necessary to meet the specific content
5 requirements of section 601 of WRDA 2000 and NEPA. A specific opportunity to reduce the
6 level of detail are the programmatic authority projects described in section 601(c) of section
7 601 of WRDA 2000 that allows the Secretary of the Army to approve certain projects in the
8 Plan that meet the criteria specified in section 601(c) of WRDA 2000.
9

10 **1.5 SEEKING IMPROVEMENTS TO THE COMPREHENSIVE PLAN**

11
12 The Plan as approved by section 601 of WRDA 2000 was not intended as an artificial
13 constraint on innovation in its implementation. Rather, the Programmatic Regulations direct
14 the USACE to seek continuous improvements to the Plan, by using new information to
15 enhance the restoration benefits of the Plan while providing for other water-related needs
16 (section 385.9 [c]). Several approaches provide opportunities to improve on the benefits of
17 the Plan. At the project level, projects can enhance performance of the Plan by including
18 features of operations that maximize system-wide benefits within the range of options
19 defined by the project's goals and objectives. Minor adjustments to the Plan may therefore be
20 accomplished through PIRs. For the Plan as a whole, the Programmatic Regulations provide
21 for a process to update the plan no less frequently than every five years, and to make
22 improvements to the Plan as needed. This is accomplished through the assessment and
23 planning activities of RECOVER (section 385.20 [e], the adaptive management program
24 [section 385.31]), the development of Comprehensive Plan Modification Reports (CPMR)
25 (section 385.32), and revisions to the Master Implementation Sequencing Plan (MISP)
26 (section 385.30).
27

28 **1.6 ELEVATION OF ISSUES**

29
30 Issues, in general, should be resolved at the lowest level possible; however, technical issues
31 that can't be resolved by the PDT, issues that affect completion schedules, and policy issues
32 should be elevated by the PDT to the appropriate authority level for resolution. Issues should
33 be coordinated through the Design Coordination Team (DCT) and the Quality Review Board
34 (QRB), as appropriate. Finally, In-Progress Review (IPR) meetings, the Feasibility Scoping
35 Meeting, and the Alternative Formulation Briefing provide an opportunity to resolve issues
36 and to document their resolution.
37

38 **1.7 IN-PROGRESS REVIEWS AND OTHER MEETINGS**

39
40 As required by applicable USACE regulations, policies, and procedures, In-Progress Review
41 (IPR) meetings with USACE vertical team and the Office of the Assistant Secretary of the
42 Army for Civil Works (OASA(CW)) will be held periodically during the development of the
43 PIR. The primary objective of IPR meetings is to discuss and resolve policy issues to ensure
44 that the PIR progresses in an orderly manner and that preparation of the final PIR is not
45 delayed. An IPR may be held at any time during the PIR process to provide an update of
46 findings and progress, identify potential problems (technical/policy), and document

1 decisions. In addition, in accordance with USACE policy and procedures, checkpoint
2 meetings such as the Feasibility Scoping Meeting (FSM) and the Alternative Formulation
3 Briefing (AFB) will be held during the development of the PIR. Senior managers from the
4 USACE vertical team, the non-Federal sponsor, and resource agencies should participate in
5 the FSM and AFB meetings to ensure that decisions are made and that appropriate guidance
6 is given to the PDT.

7
8 The Feasibility Scoping Meeting is held to bring the USACE vertical team, the OASA(CW),
9 the non-Federal sponsor, and resource agencies together to reach agreement on the problems
10 and solutions to be investigated during the PIR phase of the project and the scope of analysis
11 required. The FSM will be held after preliminary formulation and evaluation has been
12 completed and will include discussion of the following items:

- 13 • Existing and future without project conditions
- 14 • Problem and opportunities, planning objectives and constraints
- 15 • Identification and evaluation of management measures (preliminary screening)
- 16 • Determining whether plan formulation should focus on optimization or formulation of
17 additional alternatives and plans to be studied further
- 18 • System-wide and project-level performance measures
- 19 • Regional modeling assumptions and constraints including scope of analyses for
20 reviewing existing operations
- 21 • NEPA scoping results
- 22 • Regulatory coordination and regulatory issues
- 23 • Independent technical review and external peer review (if conducted)
- 24 • Policy issues or questions
- 25 • Future milestones and completion dates

26
27 The Alternative Formulation Briefing is held to bring the USACE vertical team, the
28 OASA(CW), the non-Federal sponsor, and resource agencies together to confirm that the
29 plan formulation and selection process, the tentatively selected plan, and the division of
30 Federal and non-Federal responsibilities are consistent with applicable laws, statutes,
31 Executive Orders, regulations and current policy guidance. The goal is to identify and resolve
32 any legal or policy concerns that would otherwise delay or preclude Washington-level
33 approval of the draft PIR, and to allow for the release the draft PIR to the public concurrent
34 with the Headquarters policy compliance review of the draft report. The AFB will be held
35 after identification of the tentatively selected plan and will include discussion of the
36 following items:

- 37 • Current description of future without project condition, problems and opportunities,
38 and planning objectives and constraints
- 39 • Formulation and evaluation of alternative plans
- 40 • The tentatively selected plan
- 41 • Status of WRDA assurances activities including Initial Operating Regime
42 assumptions, identification of water made available, and Savings Clause analyses and
43 potential issues
- 44 • Status of environmental compliance actions, coordination, and NEPA documentation
- 45 • Status of engineering activities

- 1 • Identification of any LERRD issues and status of real estate activities
- 2 • Status of M-CACES cost estimate
- 3 • Mitigation and monitoring requirements
- 4 • Regulatory coordination and regulatory issues
- 5 • Independent technical review and external peer review (if conducted)
- 6 • Policy issues or questions
- 7 • Status of non-Federal sponsor support
- 8 • Future milestones and completion dates

10 1.8 COORDINATION WITH RECOVER

11
12 RECOVER provides assistance to the PDT in accomplishing specific activities for the PIR.
13 These activities ensure that projects are analyzed from a system-wide perspective and include
14 planning level opportunities for adaptive management. The PDT will coordinate with
15 RECOVER on the following activities:

- 16 • **Future Without CERP Baseline**—RECOVER maintains and periodically updates the
17 system-wide Future Without CERP Baseline. RECOVER will provide the PDT with
18 the latest description, assumptions, and model version of the Future Without CERP
19 Baseline for the PIR.
- 20 • **Future With CERP Condition**—RECOVER maintains and periodically updates the
21 system-wide Future With CERP Condition. RECOVER will provide the PDT with
22 the latest description, assumptions, and model version of the Future With CERP
23 Condition for the PIR.
- 24 • **Performance Measures**—RECOVER has developed a set of system-wide hydrologic
25 and ecologic performance measures for CERP that are to be used for the evaluation of
26 alternative plans from a system-wide perspective. In addition, PDTs will have
27 RECOVER review project-level performance measures developed by the PDT to
28 ensure that the project-level performance measures are consistent with the system-
29 wide performance measures developed by RECOVER.
- 30 • **Evaluation of Alternatives**—RECOVER will evaluate alternative plans developed by
31 the PDT from a system-wide perspective using the system-wide performance
32 measures during the plan formulation and evaluation process. RECOVER will also
33 review alternatives for robustness in keeping with adaptive management opportunities
34 at the planning level. RECOVER will prepare a report to be included in the PIR, in
35 accordance with the Programmatic Regulations.
- 36 • **Project Monitoring Plans**—RECOVER has developed a system-wide Monitoring and
37 Assessment Plan (MAP) as part of the adaptive management program for CERP
38 (refer to Guidance Memorandum #6 for more information on adaptive management).
39 The MAP provides a systematic way to monitor and assess how well CERP as a
40 whole is achieving the benefits of the Plan. RECOVER will review the project
41 monitoring plan developed by the PDT to ensure that the monitoring plan is
42 consistent with the MAP, does not duplicate system-wide monitoring activities, and
43 supports application of the principles of adaptive management in implementing
44 CERP. As appropriate, RECOVER may need to consider modifications to the MAP
45 to incorporate additional system-level monitoring that is identified by the PDT.

1
2 **1.9 PLAN SELECTION**
3

4 Following the formulation and evaluation of alternative plans for the PIR (see Guidance
5 Memorandum #2), a tentatively selected plan will be identified. The tentatively selected plan
6 will be the plan that reasonably optimizes net benefits, monetary and non-monetary,
7 consistent with the objectives of the Plan. The PDT should refer to Engineer Regulation (ER)
8 1105-2-100 (Planning Guidance Notebook) for the criteria for determining the National
9 Ecosystem Restoration (NER) Plan. In accordance with ER 1105-2-100, an AFB will be held
10 to obtain approval of the tentatively selected plan as the selected alternative plan for the PIR.
11 The selected alternative plan is synonymous with the “Preferred Alternative” or the
12 “Preferred Plan” in the NEPA regulations (40 Code of Federal Regulations [CFR] 1500-
13 1508).

14
15 **1.10 REAL ESTATE CONSIDERATIONS**
16

17 **1.10.1 Lands Already Acquired for the Project**
18

19 The South Florida Water Management District (SFWMD) and others have been acquiring
20 lands needed for CERP implementation in advance of completion of a PIR, based on the
21 April 1999 “Final Integrated Feasibility Report and Programmatic Environmental Impact
22 Statement.” Under current USACE policy, the fair market value of lands, regardless of when
23 the lands are acquired, is used in plan formulation, in determining project costs, and for
24 crediting local sponsors. Due to extremely high rate of appreciation of real estate values in
25 south Florida, application of this policy for lands already acquired by the SFWMD and others
26 would result in higher project costs. As a result, the PIR will use the actual cost of the land
27 bought for the project instead of the estimated value of the land. Consequently, the PDT
28 should use actual acquisition costs in plan formulation and cost estimating, subject to those
29 costs being reasonable, allocable, and allowable. The actual amount to be credited for lands
30 acquired by the non-Federal sponsor will be determined on a case-by-case basis by the
31 Secretary of the Army and as authorized by Congress.
32

33 **1.10.2 Cost of Real Estate As Percentage of Project Cost: Individual Projects**
34

35 Current USACE policy for environmental restoration projects has a guideline that real estate
36 costs for ecosystem restoration projects should not exceed 25 percent of total project costs in
37 order to ensure that individual projects do not focus on achieving restoration or enhancement
38 solely through land purchase. The Plan presented in the April 1999 “Final Integrated
39 Feasibility Report and Programmatic Environmental Impact Statement” as a whole meets this
40 policy, with real estate costs of approximately \$2 billion for the \$8 billion plan presented in
41 1999. However, individual CERP projects can vary widely in land costs as a percentage of
42 total project costs. Individual CERP projects are exempted from the USACE guideline
43 stipulating that real estate costs for ecosystem restoration projects should not exceed 25
44 percent of total project costs; however, the CERP program as a whole will conform to the 25
45 percent of total cost policy.
46

1 **1.10.3 Estates Required for CERP Projects**

2 For all lands determined to be required for CERP projects, the interests required for
3 implementation generally will be fee simple, based on assumptions that all or a significant
4 portion of the rights in the land will be required for project purposes. Although fee
5 acquisition should be the standard estate for CERP projects, lesser estates such as flowage or
6 conservation easements should be considered, as appropriate, if the benefits of the project
7 can still be achieved with the lesser estate. The PIR should provide the rationale for such
8 lesser estates.

9
10 To verify the appropriateness of fee simple acquisition or less than fee acquisition, the PIR
11 must include the following analysis and the conclusions must be reflected in the appropriate
12 report sections. The level of detail required for the analysis will vary depending on the
13 project feature involved:

14
15 **1. Determine the Rights that Are Required to Construct and Perform Operation,**
16 **Maintenance, Repair, Rehabilitation, And Replacement (OMRR&R) for the**
17 **Project:**

- 18 • Identify the affirmative rights on the land that are required to implement the
19 project.
20 • In addition to affirmative rights that may be required, identify restrictions on use
21 (restrictive covenants) by the fee owner that are required so as not to interfere
22 with project purposes and outputs.
23 • Identify the length of time that the affirmative rights or restrictive covenants are
24 needed for the project.
25 • Determine whether constructed project features may need to be modified over
26 time due to uncertainties in science, formulation, or design (adaptive
27 management).
28 • Determine whether project land, or portions thereof, will be open for public use
29 (either active or passive uses).

30
31 **2. Other Factors to be Considered:**

- 32 • Compare the cost/value of specific types of easements to fee value.
33 • Assess potential for severance damages from fee acquisition.
34 • Determine whether public owners have legal capability to convey fee.
35 • Assess stewardship/OMRR&R considerations regarding the risk and
36 consequences of encroachment on project land by adjacent owners; the risk and
37 consequences of violation of easement terms by fee owners; and monitoring and
38 enforcement capabilities of Sponsor.
39 • Assess negative perception by public of private benefits or gain due to landowner
40 reservations where easements are selected.
41 • Assess whether State Marketable Title Act requires re-recording of easement
42 instruments.
43

1 **1.11 INFORMATION TO ADDRESS REQUIREMENTS OF FLORIDA**
2 **LAW**

3
4 The State of Florida has established procedures, requirements, and approvals under Chapter
5 373 of the Florida Statutes (F.S.) that are needed before the State or the South Florida Water
6 Management District can participate as the non-Federal sponsor for CERP projects. The
7 specific requirements are found in sections 373.026, 373.470, 373.1501. and 373.1502.
8 Project Implementation Reports will include information necessary for the non-Federal
9 sponsor to address the requirements of these sections, and other applicable planning and
10 reporting requirements of Florida law.

11
12 **1.12 CREDITING OF NON-FEDERAL SPONSOR CONSTRUCTION**

13
14 Section 601(e)(5)(B) of WRDA 2000 authorizes the Secretary of the Army to provide credit
15 to the non-Federal sponsor for construction work that the non-Federal sponsor accomplishes
16 during the period of construction pursuant to the Project Cooperation Agreement (PCA) for
17 the project and a determination by the Secretary that the work is integral to CERP. However,
18 section 601(e)(5)(B) of WRDA 2000 makes no provision for a credit for any work the non-
19 Federal sponsor constructs in advance of project authorization or the execution of a PCA.
20 Therefore, credit for construction accomplished by the SFWMD or other non-Federal
21 sponsor prior to project authorization or PCA execution requires Congressional
22 authorization. Accordingly, any PIR that includes project features constructed or expected to
23 be constructed in advance of project authorization should include a recommendation that the
24 non-Federal sponsor be credited for construction work completed prior to PCA execution,
25 subject to the Secretary of the Army determining that the work is necessary and integral to
26 the recommended project, that the costs are reasonable, allowable, necessary, auditable and
27 allocable, and that the work has been completed consistent with the USACE design and
28 construction standards and applicable Federal and State laws.

29
30 **1.13 EXTERNAL PEER REVIEW**

31
32 As required by section 601 of WRDA 2000, an independent scientific review panel has been
33 established to review the Plan's progress toward achieving the natural system restoration
34 goals of the Plan and to report to Congress on a biennial report to Congress. The
35 Programmatic Regulations require that draft pilot project technical data reports and draft
36 assessment reports for the adaptive management program be externally peer reviewed. For
37 some PIRs, external peer review may be beneficial due to technical complexity or public
38 concerns (e.g. aquifer storage and recovery [ASR]). In those cases, external peer review will
39 be considered during the preparation of the Project Management Plan in accordance with
40 USACE regulations and policy and a final decision made at the Feasibility Scoping Meeting
41 (FSM), so that external peer review can be accomplished in a timely manner and appropriate
42 adjustment to planning activities may be made as appropriate. Regardless of whether external
43 peer review is conducted, each PIR will undergo independent technical review, in accordance
44 with USACE regulations and policy.

1.14 FEATURES TO IMPROVE WATER QUALITY

Section 528(e)(2) of WRDA 1996 (Public Law [P.L.] 104-303) provides that the non-Federal share of the costs of features for water quality improvement will be 100 percent unless: the Secretary of the Army determines that a project feature to improve water quality is essential to Everglades restoration, then the cost share for the feature will be 50 percent, provided the feature is not part of the Everglades Construction Project. Subsequent to the passage of WRDA 1996, the USACE adopted guidance for implementing section 528(e)(2) of WRDA 1996 (Water Quality Policy for South Florida Ecosystem Restoration, 7 November 1997, CECW-AG by the Director of Civil Works). This policy states that in order to qualify for Federal cost sharing, CERP features providing water quality improvement must be designated as (1) water reclamation or (2) water reuse projects. For the purpose of this USACE policy, water reclamation is defined as diverting water formerly discharged to tide or otherwise disposed to increase the volume of water available for the Everglades ecosystem restoration and water reuse is defined as modifying the use of water from the water's present function (e.g., flood control) in a current location to a preferred function (e.g., hydrologic restoration) in a preferred location. The April 1999 "Final Integrated Feasibility Report and Programmatic Environmental Impact Statement" describes how this policy was applied to the projects in the Plan.

For the purpose of analyzing Federal participation in water quality features of a project, the Future Without Project Condition must be developed based on the assumption that non-Federal interests will meet the requirements of the Clean Water Act and applicable State water quality standards. The PDT should identify any features necessary to improve water quality in the PIR in a manner consistent with the cost sharing provisions of section 528 of WRDA 1996 and section 601 of WRDA 2000 so that the Secretary of the Army may determine whether the project feature is essential to Everglades restoration.

1.15 PROJECT MONITORING PLAN

RECOVER has developed a system-wide MAP that is an integral part of the adaptive management program for CERP. The MAP provides a systematic way to monitor key indicators throughout the South Florida ecosystem to assess how well implemented CERP projects are performing and how well the benefits of the Plan are being achieved, including the achievement of the interim goals and interim targets. The MAP provides information for periodic assessment reports that are required by the Programmatic Regulations as part of the adaptive management program. Consequently, project monitoring plans should not duplicate system-wide monitoring activities that are being conducted for the MAP or duplicate elements of the adaptive management program. In addition, there may be other on-going monitoring programs that the PDT should consider when designing the project monitoring plan. Accordingly, the project monitoring plan for the PIR should include only activities that are necessary to:

- comply with necessary regulatory requirements (e.g. water quality standards, Endangered Species Act, etc.); and/or
- verify that the project is functioning as designed.

1 Project monitoring plans must comply with USACE guidance for monitoring, such as cost
2 caps and length of program, unless a deviation has been approved by the vertical team. As
3 appropriate, RECOVER may need to consider modifications to the MAP to incorporate
4 additional system-level monitoring that is identified by the PDT.

5 6 **1.16 COMPLIANCE WITH FISH AND WILDLIFE COORDINATION** 7 **ACT (FWCA)** 8

9 The US Fish and Wildlife Service (FWS) is the lead Federal stewardship agency for
10 freshwater fish and wildlife resources and its advice, as well as that of the Florida Fish and
11 Wildlife Conservation Commission (FWC), will be sought by the USACE for planning
12 individual CERP projects. The FWS participates on every CERP PDT, with emphasis on
13 technical assistance to the ecosystem sub-team and evaluation of project benefits and effects.
14 The FWS provides the report of the Secretary of the Interior as required under section 2(b) of
15 the Fish and Wildlife Coordination Act (FWCA). Additionally, the FWS provides “Planning
16 Aid Letters” or PALs during PIR development, approximately every 6 months. These PALs
17 contain information on fish and wildlife resources, issues and opportunities. PALs should be
18 collated and included in early review submittals to the USACE vertical team. After the TSP
19 has been identified and verified by USACE policy review, a draft Fish and Wildlife
20 Coordination Act [draft CAR] (or section 2(b)) Report should be received from FWS.

21
22 A draft CAR should be submitted after the AFB and within 90 days of approval of the TSP.
23 It will be included in the draft PIR and integrated environmental document as an Annex. The
24 PIR should summarize and respond to FWS recommendations. After public and agency
25 coordination of the draft PIR and after revisions to the main PIR text are made and
26 coordinated with FWS, FWS will submit a final CAR, for inclusion as an Annex to the final
27 PIR and integrated environmental document. The final PIR and integrated environmental
28 document should include enough information in its paragraphs on fish and wildlife resources
29 to show responsiveness to the CAR recommendations. If the PDT disagrees with the FWS
30 recommendations, the PIR must explain why the FWS recommendations cannot be
31 implemented.

32
33 Under the FWCA, the FWC can submit a separate CAR. This document or any letter from
34 FWC describing its coordination with FWS in developing the FWS CAR must also be
35 included in the FWCA Report and Endangered Species Act Annex of the PIR (Annex A).
36 The National Marine Fisheries Service (NMFS) may also submit separate recommendations
37 for projects involving marine habitats or species.

38 39 **1.17 COMPLIANCE WITH ENDANGERED SPECIES ACT (ESA)** 40

41 The USACE is required to make a determination of effect on each and every Federally listed
42 threatened and endangered species or candidate species within the action area of each CERP
43 project. FWS manages freshwater and terrestrial listed species and their habitats, as well as
44 nesting marine turtles. NMFS manages marine species and sea turtles in the water. Because
45 evaluation of Endangered Species Act (ESA) effects may be complex and require
46 considerable time, consultation under ESA should begin as early as possible in the PIR

1 planning process. Information necessary for consultation will be provided in a timely manner
2 to allow ESA consultation to be completed prior to the finalization of the NEPA
3 documentation.

4
5 During scoping, the project environmental lead should provide a list of potentially affected
6 species in the project action area via letter to the FWS and NMFS. As alternatives are
7 formulated and evaluated, FWS and NMFS should assist the PDT to make a preliminary and
8 informal “determination of effect.” Options are: no effect (no further coordination is
9 necessary), “may affect, not likely to adversely affect” and “may affect, likely to adversely
10 affect”. The formal vehicle to coordinate with FWS and NMFS is called a Biological
11 Assessment (BA). Except in the case of “no effect” determinations, this preliminary
12 assessment should be developed by the project environmental lead and provided to the FWS
13 as soon as a TSP is identified. If the project may adversely affect one or more species or their
14 designated habitat, such that a Biological Opinion (BO) from FWS/NMFS is required, formal
15 consultation should be initiated as soon as possible, following ESA regulations, prior to
16 compilation of the draft PIR and integrated environmental document. The BA should be
17 coordinated with FWS/NMFS prior to publication of the draft PIR if possible, and included
18 in the FWCA Report and Endangered Species Act Annex to the PIR (Annex A). FWS may
19 require additional information, but once all information at the PDT’s disposal is provided,
20 FWS has up to 135 days to issue the BO. If the formal consultation is initiated at TSP and all
21 required information is submitted as required, it should be possible for FWS to issue the BO
22 prior to publication of the final PIR and integrated environmental document.

23 24 **1.18 CONSULTATION WITH TRIBES**

25
26 Section 601 of WRDA 2000 requires that the Secretary of the Army and the Secretary of the
27 Interior fulfill their obligations under the Indian trust doctrine as well as other applicable
28 legal obligations to the Indian tribes in south Florida. The Programmatic Regulations require
29 that the Corps of Engineers and non-Federal sponsors consult with and seek advice from the
30 Miccosukee Tribe of Indians of Florida and the Seminole Tribe of Florida throughout the
31 implementation process for CERP projects to ensure meaningful and timely input by tribal
32 officials. Consultation with the tribes is to be conducted on a government-to-government
33 basis.

34 35 **1.19 CONSIDERATION OF RECREATION OPPORTUNITIES**

36
37 Recreation is an authorized purpose of the C&SF Project and the C&SF Project includes a
38 number of recreation features. A Master Recreation Plan (MRP) for CERP is currently under
39 development. The primary goal of the CERP MRP is to develop a comprehensive plan for
40 addressing recreational needs within the C&SF Project consistent with the C&SF Project
41 authorized purpose.

42
43 The PDT may consider recreation opportunities in the development of the PIR. The PDT
44 should determine whether the selected alternative plan affects existing recreation features and
45 the appropriateness of mitigating adverse effects on existing recreation facilities. Additional
46 recreation features may be considered and any recreation features will be formulated in

1 conjunction with the tentatively selected plan and included with the selected plan. Recreation
2 features will be consistent with USACE regulation and policy. USACE regulations and
3 policy require that recreation at ecosystem restoration projects be compatible with these types
4 of projects and enhance the visitation experience by taking advantage of natural values (see
5 ER 1105-2-100). USACE regulations and policy also provide guidance on the types of
6 facilities that may be included and limitations on the total cost of the recreational facilities
7 that may be included with the recommended plan and the cost-sharing for such features.
8 Recreation features must be analyzed and justified in accordance with USACE regulations
9 and policy. The formulation and evaluation of the recreation features should be included in
10 the plan formulation section of the PIR. The Recreation Appendix (Appendix H) of the PIR
11 will include the recreation analyses conducted for the PIR.
12

13 **1.20 REGIONAL MODELING ANALYSES**

14
15 There are a number of system-wide baselines and with project conditions needed for the
16 formulation and evaluation process and for other analyses described in the Guidance
17 Memoranda. Table 1-1 describes the various baseline conditions that are needed for the PIR
18 while Table 1-2 describes the various with-project conditions for the PIR. Table 1-3
19 summarizes the various analyses for the PIR.
20

21 If the baseline conditions need to be updated, information is available from Federal, Tribal,
22 State, and local agencies (including county planning departments) and tribal governments.
23 Federal and State environmental and health standards and regulations, including
24 requirements outlined in Chapter 373 F.S., should be considered, as appropriate.
25

26 Any updating of the existing conditions inventory will be focused by the goals, planning
27 objectives and constraints, and approved performance measures. The existing conditions
28 include compiling information on significant environmental resource attributes (ecological,
29 cultural, and aesthetic), land use, population, water demand, and operations of the Central
30 and Southern Florida (C&SF) Project system. The information collected serves two broad
31 purposes: 1) to adequately describe the problems and opportunities at the project and system
32 level; and 2) to provide enough information to characterize the significant effects and
33 differences between the alternative plans.
34

35 The PDT should consider including, as appropriate, changes to operations in other areas of
36 the system in order to optimize the delivery of system benefits for the project being
37 formulated. Such changes should be considered only where there are direct beneficial
38 impacts to a project. For example, changes to the WCA regulation schedules should be
39 considered for projects, such as the Everglades Agricultural Area Storage Project, which are
40 designed to improve the natural hydrology in the Water Conservation Areas and Everglades
41 National Park. Changes to operations should be considered if there would be a direct
42 beneficial impact to the natural system. Whenever possible, the PDT should incorporate
43 Everglades Rainfall Driven Operations (ERDO) in the project being formulated to the
44 greatest extent possible without creating harm elsewhere. PDT recommendations regarding
45 the scope of possible operational changes will be presented at the FSM.
46

1 Information concerning the modeling conducted for a PIR should be included in the
2 Engineering Appendix (Appendix A) to the PIR. The same model runs that are used to
3 support plan formulation and evaluation will also be used for Savings Clause analyses
4 (Guidance Memorandum #3), identification of water (Guidance Memorandum #4), and
5 development of the Project Operating Manual (Guidance Memorandum #5). Consequently,
6 the PDT needs to fully document all of the assumptions of each model run.

4

1 **1.21 DETERMINING HYDROLOGIC CONNECTIONS AND SPATIAL**
2 **EXTENT OF PROJECT EFFECTS**

3
4 Attachment 1-A provides a guide for the PDT to use in: determining whether a project is
5 hydrologically separate from the regional water management system; selecting the model
6 used to perform evaluations; and identifying the spatial extent of the effects of a project.
7

8 **1.22 UPDATING THE COMPREHENSIVE PLAN**
9

10 As necessary, reformulation of the Plan will be accomplished through preparation of a
11 Comprehensive Plan Modification Report (CPMR). This is a system-wide reevaluation that
12 considers program and project-level considerations and should not be confused with
13 formulation of individual CERP projects. Project level formulation activities during the PIRs
14 are intended to address optimization of the project's contribution to the system-wide goals
15 and objectives in general, and project goals and objectives more specifically. While a PIR
16 may result in project modifications that impact or modify system output, these modifications
17 are not intended to address system-wide issues within the comprehensive plan.
18

19 **1.23 MAJOR PIR ACTIVITIES**
20

21 Preparation of the PIR involves three major groups of activities: develop base conditions and
22 models; plan formulation and evaluation; and design of the selected plan. In general,
23 developing base conditions and models is similar to Steps 1 through 3 in the USACE
24 planning process; plan formulation and evaluation is similar to Steps 3 through 6 and the
25 final group provides more detailed information on the selected plan including the analyses
26 required by section 601 of WRDA 2000, the Programmatic Regulations, and the other
27 requirements that are set forth in these Guidance Memoranda. Attachment 1-B provides more
28 detailed information on all these activities.
29

30 **1.23.1 Develop Base Conditions and Models**
31

- 32 1. Review the information provided in the Plan regarding the project's purpose, cost,
33 benefits, and contributions to achieving the goals and purposes of the Plan.
- 34 2. Conduct NEPA scoping to identify problems and opportunities, constraints, and other
35 issues related to the project. Scoping should explore the problems and opportunities
36 (at the local, regional, and system level), as well as describing any agency or public
37 workshops that were held to gather additional information on the problems and
38 opportunities. RECOVER should be consulted as part of the scoping process for
39 assistance in identifying problems and opportunities. Scoping will reveal any new
40 issues or opportunities or lead to gathering new data and information.
- 41 3. Revise the above information if needed, by developing additional problems and
42 opportunities, project goals, and planning objectives and constraints. Confirm that all
43 additional goals, objectives, opportunities and constraints contribute to achieving the
44 Plan's goals and purposes.

- 1 4. Obtain the Pre-CERP Baseline, the Future Without CERP Baseline, and the Future
2 with CERP Condition which are provided by RECOVER. Also, develop the Existing
3 Conditions Baseline.
- 4 5. Determine the availability of Pre-CERP Baseline water and identify existing water
5 reservations or allocations.
- 6 6. Update the cost of the project described in the Plan based on updated information.
- 7 7. Develop project performance measures and targets, including the tools to measure
8 differences between the performance of alternative plans. The conceptual ecological
9 models developed for the South Florida ecosystem should guide the selection of the
10 ecological performance measures; other ecological and hydrologic performance
11 measures should be applied as needed. RECOVER should be consulted for assistance
12 in developing project level performance measures and selection and development of
13 tools to measure differences in alternative plan performances.
- 14 8. Conduct an initial screening effort to determine if the project as described in the Plan
15 will still achieve the benefits as described in the Plan in a cost-effective manner.
16 Rough order of magnitude costs should be presented for the alternatives. RECOVER
17 should be consulted in evaluating the project's contributions towards meeting the
18 goals and purposes of CERP.
- 19 9. Hold a FSM to determine whether plan formulation should focus on optimization and
20 detailed design of the project described in the Plan, or if additional alternative plans
21 should be formulated. The extent of additional plan formulation will be based on
22 whether the project will still achieve the benefits of the project as described in the
23 Plan in a cost-effective manner.

24 **1.23.2 Plan Formulation and Evaluation**

- 25 1. If it is determined that the PIR effort should continue with optimization and detailed
26 design of the project described in the Plan, then the PDT should develop alternative
27 design configurations to optimize the project described in the Plan. Optimization is
28 conducted to enhance design, size and/or configuration of the project components and
29 to achieve outputs required for the system in a cost-effective manner, and includes the
30 following activities:
 - 31 a. Develop alternative design configurations.
 - 32 b. Evaluate and compare alternatives using approved hydrologic and ecologic
33 performance measures and screen for potential Savings Clause concerns using
34 appropriate indicators.
 - 35 c. Determine which of the alternative plans are considered cost-effective, based on a
36 comparison of the selected hydrologic and ecologic outputs and their costs.
 - 37 d. Retain only cost-effective alternatives for further analysis by eliminating
38 alternative plans that are not cost-effective.
 - 39 e. Conduct NEPA evaluation of the no-action alternative (i.e. NAI Baseline) and all
40 alternative plans developed. Conduct other environmental analyses including the
41 Endangered Species Act and cultural resources assessments.
- 42 2. If additional alternative plans need to be developed, formulate additional alternatives
43 by developing management measures at different scales or sites to meet the project's
44 goals and purposes and includes the following activities:
45
46

- a. Develop the plan formulation strategy
 - b. Formulate alternative plans
 - c. Evaluate and compare alternatives using approved hydrologic and ecologic performance measures and screen for potential Savings Clause concerns using appropriate indicators.
 - d. Determine which of the alternative plans are considered cost-effective, based on a comparison of the selected hydrologic and ecologic outputs and alternative plans costs.
 - e. Retain only cost-effective plans for further analysis to demonstrate the efficiency (cost per unit of output) for successively larger (greater output) cost-effective plans. Based on this analysis, describe why some alternative plans were eliminated and identify the alternative plans retained.
 - f. Conduct NEPA evaluation of the no-action alternative (i.e. NAI Baseline) and all alternative plans developed. Conduct other environmental analyses including the Endangered Species Act and cultural resources assessments.
3. Identify a tentatively selected plan based on the evaluation and comparison analyses that identifies the plan with the greatest net system-wide benefits produced by a project (as measured by appropriate outputs and consistent with ER-1105-2-100 plan selection criteria).
 4. Conduct NAI analyses on the tentatively selected plan to determine the level of output or benefits that can be achieved in absence of unauthorized or unapproved CERP projects (Guidance Memorandum #2).
 5. As appropriate, incorporate justified recreation components into the tentatively selected plan.
 6. Hold an AFB to obtain approval of the tentatively selected plan as the selected alternative plan and permission to simultaneously release the draft PIR to the public, USACE vertical team and OASA(CW)) for review.

1.23.3 Design Selected Plan

1. Develop the Initial Operating Regime (IOR).
2. Complete design analyses on the selected alternative plan including:
 - a. Engineering design
 - b. Real estate information, including takings analysis
 - c. Micro-Computer Aided Cost Engineering System (M-CACES) cost estimate
3. Complete additional analyses on the selected alternative plan to comply with Federal and State laws concerning CERP projects. These include:
 - a. Determining if there has been an elimination or transfer of existing legal sources of water (Guidance Memorandum #3).
 - b. Confirming that the level of service for flood protection in existence on the date of enactment of WRDA 2000 and in accordance with applicable law will not be reduced by implementation of the project (Guidance Memorandum #3).
 - c. Identifying the total water necessary to achieve the benefits of the project and the water made available by the project, and the amount of water to be reserved or allocated for the natural system (Guidance Memorandum #4).

- d. Describing the project's contribution to the achievement of the interim goals and interim targets.
 - e. Determining compliance with applicable water quality standards and permitting requirements.
 - f. Providing, as appropriate, information necessary for the non-Federal sponsor to address the requirements of Chapter 373 of the Florida Statutes (F.S.), and other applicable planning and reporting requirements of Florida law.
4. Compare the selected alternative plan's costs to the component's cost described in the Plan (or section 902 of WRDA 1986 cost limit for the initially authorized projects in section 601 of WRDA 2000) to determine if there are any issues related to increases in cost, excluding inflation. If a cost issue exists, an IPR meeting will be held to resolve the issue.
 5. Develop the Draft POM (Guidance Memorandum #5).
 6. Develop the project monitoring plan.
 7. Develop an implementation schedule for the project. Compare the project's schedule and costs to the MISP. Based on this comparison, adjustments to the project's scheduling or the MISP may be necessary.
 8. Determine the allocation of costs between the USACE and the non-Federal sponsor.

After these three major groups of activities are completed, the draft PIR will be prepared for coordination with agencies and the public. After the draft PIR has been coordinated with agencies and the public, the final PIR will be prepared for review and approval in accordance with USACE regulations and policy.

1.23.4 Relationship Among PIR Tasks

Figure 1-3 shows the relationships and sequencing of major tasks which are described in these Guidance Memoranda. Plan formulation and evaluation activities to identify the tentatively selected plan (TSP) are conducted as described in Guidance Memorandum #2. After the TSP is identified, the Initial Operating Regime (IOR) can be developed and modeled, as described in this Guidance Memorandum. After the IOR modeling is completed, the Savings Clause analyses (see Guidance Memorandum #3) are conducted. That is followed by the identification of water made available and the identification of water to be reserved or allocated for the natural system, as described in Guidance Memorandum #4, as well as the development of the Draft Project Operating Manual, as described in Guidance Memorandum #5.

Figure 1-3: Relationship among PIR Tasks

1.24 FORMAT AND CONTENT OF PIRS

The activities conducted for the PIR and the results of those activities will be documented in the PIR. Attachment 1-C provides an outline for the content of the PIR. The PIR must contain the detail necessary to satisfy Federal statutory requirements (e.g., NEPA), USACE regulations (e.g., ER 1105-2-100 Planning Guidance Notebook), CERP specific guidance (e.g., Programmatic Regulations), and State Laws (e.g. F.S. section 373.1501). The information pertaining to these requirements should be included in the body of the main report or within the appropriate Annex. The Annexes of the PIR are considered an integral part of the main report and should always accompany the main report as the Annexes contain detailed information necessary to satisfy these requirements. The Appendices include detailed technical information that may not be required by all readers and is not considered part of the main report.

The format for a PIR is standard for all CERP projects. The format is designed to facilitate the documentation of information, processes and decisions that occur in the planning process, and includes guidelines that are specific to formulating and evaluating CERP projects (e.g., performance measures, system benefits, and NAI). Since the PIR is an integrated document, the format also provides technical information necessary to fulfill NEPA requirements.

The PIR should be prepared using the fonts, margins and spacing designated in the approved CERP Master Program Management Plan (MPMP) and USACE standards. If the MPMP is revised during development of the PIR, the MPMP standards in place at the initiation of the planning process should be used. The use of pictures, maps and graphics is encouraged throughout the document to provide visual depictions of pertinent information. In addition, to facilitate clear and concise explanation of data, information should be displayed in tabular format whenever possible.

ATTACHMENT 1-A DETERMINING HYDROLOGIC CONNECTIONS AND SPATIAL EXTENT OF PROJECT EFFECTS

10
11
12
13
14
15
16
17
18
19
20
21
22
23
24

This attachment provides a guide for Project Delivery Teams to use in: determining whether a project is hydrologically separate from the regional water management system and; selecting the appropriate models to perform evaluations; and identifying the spatial extent of the effects of a project.

DETERMINE WHETHER THE PROJECT IS HYDROLOGICALLY SEPARATE

25
26
27
28
29
30
31
32
33
34

During plan formulation and evaluation, the PDT should determine whether the project is hydrologically connected to, or separate from, the regional water management system. Most of the components that comprise the Plan are hydrologically connected. For these projects, a hydrologic connection (i.e., surface water flow via canal discharges, sheet flow, and groundwater flow) exists between the components through the regional water management system (i.e., the C&SF Project and associated secondary and tertiary water conveyance structures). Hydrologic connections between projects and the regional water management system may also be created by seepage or groundwater flow. The synergistic effect of the components due to hydrologic connectedness was recognized during the initial formulation of Plan alternatives.

35
36
37
38
39
40
41
42

However, some components of the Plan are hydrologically separate from the regional water management system. Projects may be hydrologically separate for several reasons, including:

- The project does not have hydrologic connections to the regional water management system;
- The project, though hydrologically connected, is too small in scope to meaningfully affect the quantity of water available in the regional water management system, with the result that project effects can not be discerned with the regional modeling tools; and,
- The project does not involve substantial hydrologic alterations.

While a project may be hydrologically separate from the regional water management system, the project may have effects outside of the intended footprint or basin. Guidance for determining the spatial extent of project effects is found later in this attachment. That section also provides guidance to the PDT if the discovery is made that the project results in a change to the boundary condition in the sub-regional model. When this occurs, the project can no longer be considered to be hydrologically separate. If the PDT determines that a project is hydrologically separate, this analysis should be presented at the FSM.

1 **SELECT THE MODEL TO USE TO PERFORM THE EVALUATIONS**

2
3 The type of model used is dependent upon the expected effects of the project. For those
4 projects that will result in system-wide effects and benefits, a regional-scale computer model,
5 such as the South Florida Water Management Model (SFWMM), should be used. However,
6 if the project area is not covered by a regional-scale model, or if a project component is too
7 small to be modeled by a regional scale model or is hydrologically separate from the regional
8 water management system, sub-regional models can be used.

9
10 Identification of potential regional system effects from projects that fall outside the domain
11 of the current system-wide hydrologic model or from projects that use only local project-
12 scale models is important. If the project-scale modeling predicts changes to hydrology
13 components used as boundary conditions in the system-wide model (inflows, outflow or
14 stages), the system-wide model should be applied with the updated boundary conditions to
15 determine the upstream or downstream effects on the water management system and natural
16 areas. Examples include: a project in the Kissimmee Chain of Lakes area outside the
17 boundary of the system-wide hydrologic model that increases or decreases inflows to Lake
18 Okeechobee, or a project in the Caloosahatchee Basin that reduces the amount of outflow
19 that can be sent from Lake Okeechobee to the Caloosahatchee River. These changes in Lake
20 Okeechobee flows should be analyzed with the system-wide model to determine potential
21 system-wide effects. In the event that boundary conditions in the system-wide model are
22 modified as a result of project-scale modeling, RECOVER should be consulted to determine
23 the potential effects to other projects.

24
25 Typically, hydrologic data (e.g., rainfall, surface and groundwater elevations, and flow) are
26 used in a numerical model to simulate the project's hydrologic, hydraulic, environmental and
27 economic effects. Other statistical tools may also be used to evaluate project effects.

28
29 The PDT should use the same model, including model version, to evaluate alternative plans,
30 calculate benefits, quantify water, and develop operating criteria that are used in the
31 preparation of Operating Manuals. If multiple models are required such as a site-specific
32 model and regional model, the PDT should use consistent boundary conditions and
33 assumptions. Selected models should also meet the following criteria:

- 34 • Simulate major components of the hydrologic cycle in South Florida including
35 rainfall, evapotranspiration, infiltration, overland and ground water flow and their
36 interactions, canal flow, canal-ground water seepage, levee seepage, and ground
37 water pumping.
- 38 • Incorporate current or proposed water management operational procedures, regulation
39 schedules, and control structures, consumptive use demands, land use, and current or
40 proposed operational rules, consistent with the existing conditions baseline.
- 41 • Simulate effects of implementing water shortage policies on urban and agricultural
42 water uses, and natural systems.
- 43 • Utilize a spatial resolution that is appropriate for the size of the project and expected
44 effects.

- 1 • Reflect potential hydrologic and ecologic effects resulting from the project consistent
2 with the approved performance measures for the project.
- 3 • Utilize time steps that permit the evaluation of changes in quantity, timing, and
4 distribution which is particularly important for analyses required in Guidance
5 Memorandum #3 and Guidance Memorandum #4.
- 6 • Affirm the State and Federal assurance requirements pertaining to existing legal
7 sources of water, level of service for flood protection, and existing legal users.
- 8 • Incorporate boundary conditions from the regional scale model.
- 9 • The time series of data (beginning with the date of the first data point through the date
10 of the last data point) that comprises the full range of known conditions constitutes
11 the period-of-record for undertaking this analysis. The longest time period of
12 hydrologic or meteorological data that is available is recommended for this analysis.
13 If a shorter period is used, the full range of hydrologic conditions should be
14 represented including inter- and intra- annual variations due to droughts, periods of
15 high and low water levels and natural fluctuations. An appropriate period-of-record
16 will include natural fluctuations in rainfall and water levels, including droughts and
17 periods of high water levels. Uncertainty about the adequacy of the data for compiling
18 an appropriate climatic period-of-record should be reflected in project documents. All
19 simulations considered should use the same period of climatic record.
- 20 • Where appropriate, a spatially explicit hydrologic simulation model should be utilized
21 in this analysis. The grid-scale of these models should be capable of resolving the
22 spatial variability of landscape features in the project area.

23 24 **IDENTIFY AND DESCRIBE THE SPATIAL EXTENT OF THE** 25 **HYDROLOGIC EFFECTS OF THE PROJECT**

26
27 The PDT is responsible for identifying the spatial extent of project effects for quantifying
28 benefits of the project, performing Savings Clause evaluations, and quantifying water made
29 available by the project within that geographical boundary. This should be done for all
30 projects regardless of whether the project is hydrologically separate from the regional water
31 management system. Even though hydrologically separate projects may not affect the
32 regional system, these projects may have effects outside the intended footprint or basin in
33 which these projects reside.

34
35 Projects may result in changes in water availability for the natural system and other water-
36 related needs in two general ways:

37 1. System-wide effects

38 Hydrologic effects that occur outside of the watershed or basin in which the
39 project is located through the storage, management, treatment, and delivery of
40 water via the regional water management system.

41 2. Project-level effects

42 Hydrologic effects that occur within the watershed or basin in which the project is
43 located (e.g., natural areas, wetlands, salinity control) or within the features of
44 project components (e.g., reservoirs, storm water treatment areas, wellfield
45 recharge distribution canal).

46

1 Determining the spatial extent of project effects is done by first identifying the basins or
2 watershed where the project is located and where other structural or operational changes
3 occur. These are the basins in which the PDT should look for project-level effects. Next, the
4 boundary conditions for those basins or watersheds are compared against the without project
5 simulation. If the boundary conditions did not change, the PDT can assume that areas or
6 regions outside of the basin in which the project resides are not affected and do not need to
7 be analyzed for plan formulation purposes. However, if changes in the boundary conditions
8 are observed, the PDT must then progressively evaluate the boundary conditions for the
9 adjacent basins or watersheds until the team reaches a boundary where the conditions remain
10 constant. Modeling results should be evaluated to look for project effects in each basin or
11 watershed in which the PDT identified boundary condition changes. These are potential areas
12 in which the CERP project may produce effects.

13

14 If the PDT uses a sub-regional model, the same boundary condition method should be
15 employed with one additional step. If the boundary conditions change, these changes should
16 be fed back into the regional model to determine how far the changes propagate throughout
17 the regional system. This is also an indication that the project is hydrologically connected to
18 the regional water management system and has system-wide effects.

19

4

ATTACHMENT 1-B OVERVIEW OF MAJOR PIR ACTIVITIES

5 This attachment provides more detailed information about the major activities that are to be
6 conducted and documentation that is needed to complete a PIR. The three major categories of
7 activities are: develop base conditions and models; plan formulation and evaluation; and
8 design selected plan. These activities will be documented within the PIR as outlined in
9 Attachment 1-C.

10
11

I. Develop Base Conditions and Models

12
13 Each component or project of the Plan has previously been formulated to a certain level and
14 the component or project has been developed to accomplish specific CERP goals. As such,
15 formulation in the PIR always begins with the formulation already completed in developing
16 the Plan. The PDT should extract the information from the Plan documents and continue the
17 formulation and evaluation necessary to complete the PIR. In most cases, it is envisioned that
18 this process will entail optimization of the component detailed in the Plan. However, in some
19 cases, additional formulation may be needed.

20
21

A. Project Purpose and Need

22
23 *Review the purpose, background, and contextual setting of the project as*
24 *described in the Plan, and describe how this individual project is linked to the*
25 *system by providing system-wide, regional and project area and benefit*
26 *descriptions. This information will be found in the Plan or other previous*
27 *studies and will be compiled, summarized and updated, if necessary.*
28
29

30

1. Purpose and Background

31 **Project Purpose**-Determine the CERP goals and purposes that apply to this project and
32 the project-specific objectives as described in the “Final Integrated Feasibility Report and
33 Programmatic Environment Impact Statement” dated April 1, 1999, or subsequent Plan
34 documents, incorporating changes in the project’s scope since the completion of the Plan.

35
36 **CERP Partnership and Cooperating Agencies**-Document the USACE and non-Federal
37 sponsor partnership for this project. Document the roles of cooperating agencies and the
38 roles of any other agency or stakeholder involvement.

39
40 **Relationship to Other USACE/Non-Federal Sponsor Efforts, Studies, Documents,**
41 **and Projects**-Document other ongoing and completed efforts or research that pertains to
42 this project or the CERP component.

1 **2. Project Need and Setting**

2 **Pre-CERP Conditions**-Document the conditions in the South Florida ecosystem that
3 existed prior to implementation of CERP. This information should be available in the
4 Plan documents.

5
6 **Project Area**-Determine the location and boundaries of the project area, and the resource
7 concerns in the project area.

8
9 **Prior Studies**-Document prior studies and projects in the project area, both CERP and
10 non-CERP.

11
12 **B. Identify Problems and Opportunities, Objectives and**
13 **Constraints, and Evaluation Criteria**

14
15
16 *Identify the issues and concerns of the area and prepare documentation of the*
17 *coordination and involvement that was included to accomplish the scoping of*
18 *problems and opportunities; identify the objectives and constraints, and*
19 *performance measures for the project.*

20
21 *Note: Problems and opportunities, as well as planning objectives and*
22 *constraints, should already be defined in the Plan. PIRs should only address*
23 *those objectives and constraints, plus additional issues that emerge from*
24 *scoping with public, agency, and stakeholder involvement. Use of a table to*
25 *depict this information is advised. Document the development of additional*
26 *objectives beyond those described in the Plan.*

27
28
29 **1. Identification of Problems and Opportunities**

30 **Existing Information from the Plan**-Document the problems and opportunities as
31 described in the Plan documents.

32
33 **Scoping Problems and Opportunities**-Conduct a scoping process to explore problems
34 and opportunities (at the local, regional, and system level). Document the range of
35 problems and opportunities that were explored for the PIR including an explanation of
36 why problems were either eliminated or retained for consideration in this PIR.

37
38 **Problem and Opportunity Statements**-Develop problem and opportunity statements for
39 the PIR based on the review of information from the Plan and on information received
40 during the scoping of problems and opportunities.

41
42 **2. Identification of Planning Goals, Objectives, and Constraints**

43 **Identify the Project Goals**- Determine the project goal(s) to be achieved, based on the
44 Plan's goals and problem and opportunity statements.

1 **Planning Objectives and Constraints**-Develop the planning objectives and constraints
2 for the project. Determine how the objectives and constraints link to resolution of a
3 problem or achievement of an opportunity. Show how objectives lead to achievement of
4 project goals. Show how the project planning objectives and constraints relate to
5 approved system-wide performance measures. Explain why issues were either eliminated
6 or retained for consideration in the PIR.
7

8 **3. Development of Project Evaluation Criteria**

9 **Description of Evaluation Criteria Selection Process**-Develop project performance
10 measures, including the tools to be used to calculate the results. Differentiate between
11 quantitative, measurable performance measures and targets, and qualitative evaluation
12 criteria.
13

14 **Relationship to Planning Objectives and Constraints**-Develop a display (e.g., table or
15 chart) that shows the relationship between each performance measure and evaluation
16 criterion, and the planning objectives and constraints for this project. Graphics should be
17 utilized to show progress towards meeting more natural hydrology and flow in the natural
18 system.
19

20 **Relationship to CERP System-Wide Performance Measures**-Develop a display (e.g.,
21 table) that shows the relationship between system-wide performance measures developed
22 by RECOVER and any project performance measures developed by the PDT.
23

24 **4. Choosing Evaluation Methods and Models**

25 **Investigation of Evaluation Methods and Models**-Research and investigate viable
26 methods and models to evaluate alternative plan benefits.
27

28 **Overview of Selected Methods/Models**-Determine the evaluation methodology to be
29 selected for the PIR, and reasons for selecting that methodology. Determine the benefits
30 that will be measured for this PIR including how the benefits relate back to the planning
31 objectives, and problems and opportunities.
32

33 **C. Existing and Future Without Conditions of the Area**

34
35 *The Project Delivery Team will develop or document: 1) the Existing*
36 *Conditions Baseline; 2) forecasted conditions in the future if CERP is not*
37 *implemented at all (Future Without CERP Baseline); 3) the forecasted*
38 *conditions in the future if all of the Plan is implemented; and 4) the forecasted*
39 *conditions in the future, if no further CERP projects are approved (NAI*
40 *Baseline).*
41

42 **Existing Conditions Baseline**-Determine the general existing conditions of the project
43 area, region, and system. Include resource usage and demands. Describe the CERP
44 projects that have been authorized with approved Operating Manuals and the non-CERP
45 activities with approved operating plans. Effective use of maps, tables, graphs, charts,
46 and pictures is important.

1
2 **Future Without CERP Baseline**-Document the system-wide conditions at the end of the
3 period of analysis without implementation of any of the projects of the Plan. This
4 information is available from RECOVER.

5
6 **Future With CERP Condition**-Document the system-wide conditions at the end of the
7 period of analysis assuming implementation of all of the projects of the Plan. This
8 information is available from RECOVER.

9
10 **Next-Added Increment Baseline**-Determine the local, regional, and system-wide
11 conditions at the end of the period of analysis (and several points along the way),
12 assuming CERP projects already approved are in place, but no other CERP projects are
13 implemented. Forecast and summarize resources. This summary should depict the general
14 state of resource conditions, usage, and demand. Use maps and graphics to help whenever
15 possible.

16
17 **Availability of Baseline Water**-Determine the availability of Pre-CERP Baseline water
18 for the natural system.

19
20 **Consideration of Existing Water Reservations or Allocations**-Determine if there are
21 any existing reservations or allocations of water made under State law either for CERP or
22 for non-CERP activities that need to be considered.

23
24 **Comparison of Significant Resources in the Existing and Future Without**
25 **Conditions**-Determine and quantify, as appropriate, the current and future resources
26 without the proposed project in place. Show how the existing state of significant
27 resources compares to the state of significant resources at several points throughout and
28 at the end of the period of analysis. A table is recommended to compare resources (which
29 may include hydrology; water management; physical landscape; water resources; water
30 supply; flooding; navigation; water quality; natural environmental; threatened and
31 endangered species; essential fish habitat (EFH); socio-economic setting; land uses;
32 cultural/historical resources; climate/weather; air quality; noise; recreation; aesthetics;
33 hazardous, toxic and radioactive wastes; and transportation and other infrastructure).

34 35 **II. PLAN FORMULATION AND EVALUATION**

36 37 **A. Plan Formulation**

38
39 *Determine whether plan formulation should focus on continuing with*
40 *optimization and detailed design of the alternative described in the Plan or if*
41 *additional plans should be formulated. Formulation and evaluation*
42 *procedures are discussed in Guidance Memorandum #2.*
43

1 **1. Optimizing the Alternative Defined in the Plan**

2 If the project described in the Plan will still achieve the benefits of the project as
3 described in the Plan in a cost-effective manner, then the PDT will develop design
4 alternatives to optimize the project described in the Plan. Such optimization alternatives
5 might include incremental changes in component size, configuration, or specific location.
6

7 **2. Formulation of Additional Plans**

8
9
10 *When additional alternatives need to be formulated to meet the planning*
11 *objectives, develop alternatives for achieving the planning objectives and*
12 *performance measure targets that were established earlier in the planning*
13 *process. Identify the screening criteria used in order to eliminate management*
14 *measures and alternative plans at this point in the planning process. Describe*
15 *how the screening criteria were applied and clearly describe why those*
16 *screening criteria were appropriate to use at this point in the process. A*
17 *flowchart may be useful.*
18

19
20 **Alternative Plan Described in Comprehensive Plan-**Document how well the project
21 that was included in the Plan does (or does not) achieve the benefits of the project as
22 described in the Plan based on current conditions. Document any new or changed
23 circumstances; conditions or other considerations that may affect project performance.
24 For example: project conditions and objectives may have changed since the Plan was
25 approved; new scientific research may have provided new information regarding project
26 goals, objectives or feasibility; or adaptive management activities may indicate new or
27 changed needs.
28

29 **Develop Plan Formulation Strategy-**Develop a strategy for formulating alternative
30 plans. The PDT should consider questions such as: how will measures be developed and
31 how will measures be used to develop alternative plans in developing the strategy.
32

33 **Development of Management Measures-**Develop operational, structural, and non-
34 structural measures to meet the planning objectives and constraints and CERP goals and
35 purposes. Describe the information used, and who was involved (e.g. stakeholder/team
36 involvement, public input).
37

38 **Development of Screening Criteria-**Develop screening criteria based on approved
39 performance measures and project objectives and constraints, and include what
40 information was used, how values were set for each screening criteria and who was
41 involved (e.g., stakeholder/team involvement, public input). Document how system-wide
42 performance measure targets were considered in screening criteria development.
43 Document the application of the screening criteria and provide lists of management
44 measures or features eliminated and management measures or features retained for
45 further consideration.
46

1 **Organizing Measures into Alternative Plans**-Document the process of organizing,
2 linking, and combining management measures to create alternative plans. List the
3 alternative plans formulated and show how each alternative plan performs with respect to
4 the screening criteria applied at this point. Identify the screening criteria applied and
5 explain how the PDT used the criteria to determine which alternatives would be
6 eliminated and which would be retained for further consideration. A table format may be
7 useful. Be sure to document the relationship of each alternative plan to the planning
8 objectives and constraints, and consideration of CERP system-wide performance measure
9 targets.

10
11 **Screening of Alternative Plans**-Screen alternative plans using the developed screening
12 criteria. Determine the alternative plans to be eliminated from further evaluation and the
13 alternative plans to be retained for further evaluation. Document the reasoning for
14 elimination using screening criteria results.

15 16 **B. Evaluation of Alternative Plans**

17
18 *Evaluate the changes each alternative plan would make when compared to the*
19 *Future Without CERP Baseline. It is this difference between the Future*
20 *Without CERP Baseline and the future with each alternative plan that defines*
21 *the outputs or benefits of the alternative plan. Refer to Guidance*
22 *Memorandum #2 for specific information about the evaluation process.*
23

24
25 Determine how the changes in future with conditions are related to project objectives.
26 This is not an absolute comparison. Each alternative plan will likely have differing levels
27 of success for each objective and performance measure. It is important to reflect those
28 differences, since that will aid the selection of the final alternative plan from the group of
29 likely candidates.

30
31 Document the process by which alternative plans were evaluated, making sure to discuss
32 any and all iterations. A table may be an effective way to display this information.
33

34 **Overview of Future Conditions with Each Alternative Plan**-Determine the general
35 conditions of the project area, region, and system in the future with each alternative plan
36 in place. This should depict the overall state of the resource conditions, usage and
37 demands that are predicted and likely for the period of analysis for this project. Use of
38 maps and pictures is encouraged to assist in describing the future with conditions for each
39 alternative.

40
41 **Comparison of Significant Resources (Alternative Plans vs. Future-Without CERP**
42 **Baseline)**-Quantify, as appropriate, the different future with and without conditions for
43 significant resources. Furthermore, show how the state of significant resources in each
44 alternative plan compares to the state of significant resources in the future without
45 condition. Table format is recommended for reflecting this comparison across resources
46 (e.g., hydrology; water management; physical landscape; water resources; water supply;

1 flooding; navigation; water quality; natural environmental; threatened and endangered
2 species; EFH; socio-economic setting; land uses; cultural/historical resources;
3 climate/weather; air quality; noise; recreation; aesthetics; hazardous; toxic and
4 radioactive wastes; transportation and other infrastructure; cumulative impacts;
5 unavoidable adverse effects; relationship between short term uses and long term
6 productivity; irreversible or irretrievable commitments of resources; incomplete or
7 unavailable information; and benefits associated with alternative plans). RECOVER will
8 prepare an evaluation of the alternative's contribution towards achieving the system-wide
9 goals and purposes of CERP, including, as appropriate, suggestions for improving the
10 performance of the selected alternative plan. The RECOVER evaluation will be included
11 in the PIR as required by the Programmatic Regulations.

12
13 **Savings Clause Considerations**-While the required Savings Clause analysis will be
14 conducted on the selected alternative plan, the PDT should consider any major potential
15 Savings Clause issues that have been identified for each alternative plan evaluated at this
16 point. Guidance Memorandum #3 provides details on the Savings Clause analyses.

17 18 **C. Comparison of Alternative Plans**

19
20 *Document the outcome of comparing all alternative plans to identify the*
21 *differences among the alternative plans. Describe the relationships between*
22 *outputs and the alternative plan costs. Conduct cost-effectiveness (CE) and*
23 *incremental cost analysis (ICA), as appropriate.*

24 25 26 **1. Alternative Plan Comparison**

27 **Alternative Plan Achievement of Objectives**-Document each alternative plan's degree
28 of achievement of planning objectives and performance targets (table is recommended).
29 Include sufficient detail to show differences in performance between alternative plans. If
30 performance measures are too coarse to show differences, the PDT should document this
31 and describe other potential performance measures or methods of determining differences
32 between plans.

33
34 **Alternative Plan Effects**-Compare and evaluate benefits, both monetary and non-
35 monetary, based on approved performance measures for alternative plans. Identify the
36 resources (if any) that may be adversely affected. Explain how various benefits relate to
37 the quality of the intended project outcome. Document if trade-offs occur in the
38 attainment of one or more planning objectives. Discuss the consequences of trade-offs
39 and relative importance of each objective affected.

40
41 **Significance of Ecosystem Outputs**-Determine the significance, from a planning
42 perspective, of ecosystem outputs each alternative plan would produce. Along with other
43 evaluation techniques, this information will help determine whether the proposed project
44 is worth the cost, and whether a particular alternative should be recommended.
45 Significance should be described in terms of institutional, public and/or technical
46 importance. Basis for such significance includes: (1) acknowledgment of output

1 importance in laws, policies, and adopted plans; (2) volunteer or financial support or
2 cultural veneration of a resource by a segment of the general population; (3) scarcity,
3 limiting nature to survival/recovery of species, connectivity, recoverability, declining
4 status or downward trend, and biodiversity of the ecosystem outputs.

5
6 **Alternative Plan Comparison**-Document the process for elimination of certain
7 alternative plans (if any) from further comparison and list the alternative plans retained
8 for further consideration. Include a discussion of the four Principles and Guidelines
9 criteria (completeness, effectiveness, efficiency, and acceptability) and the degree to
10 which each alternative plan satisfied them. A table may be useful for this purpose.
11 Discuss alternative plans that were eliminated based on this analysis.

12
13 **Costs of Alternative Plans**-Determine the construction cost estimates of each plan
14 feature, as well as other costs associated with implementation, operation, and
15 maintenance of each alternative plan.

16 **2. Cost-Effectiveness/Incremental Cost Analyses of Alternative Plans**

17 **Overview of Cost-Effectiveness Analysis**-Determine which of the alternative plans are
18 considered cost-effective, based on a comparison of the ecological outputs (or surrogates,
19 if necessary) provided and their costs. Only cost-effective alternative plans should be
20 retained for further analysis. Based on this analysis, document why some alternative
21 plans were eliminated and identify the alternative plans retained.

22
23
24 **Incremental Cost Analyses of Alternative Plans**-In cases where additional alternative
25 plans other than the optimized component from the Plan have been developed, an ICA is
26 necessary to evaluate each alternative plan. Calculate incremental costs and incremental
27 outputs for the cost-effective alternative plans to determine which are “best buy”
28 alternatives (e.g., greatest return of ecological outputs or surrogates if necessary for a
29 given level of investment). The ICA will be necessary to demonstrate the efficiency (cost
30 per each additional unit of output) for successively larger (greater output) cost-effective
31 plans. If all of the alternative plans yield identical outputs, cost-effectiveness analysis
32 (which identifies the least cost alternative plan) will be the critical procedure.

33 **3. Trade-Off Analysis**

34 Describe any trade-offs that are being evaluated among the benefits, monetary and non-
35 monetary, associated with the planning objectives (and approved performance measures).
36
37

38 **4. Risk and Uncertainty Analysis**

39 **Level of Risk and Uncertainty**-Determine the level of risk or uncertainty that is
40 associated with any factor of an alternative plan (e.g., structural integrity, land suitability,
41 and ecological return). In addition, identify any uncertainties associated with assumptions
42 made during the planning process, predictions of future conditions, models and
43 methodologies employed, and cost estimates. The uncertainty analysis should be as
44 quantitative as feasible. A tabular format may be helpful. Knowing where the sources of
45 greatest uncertainty lie is important. Describe any risks foreseeable to the achievement of

1 project goals if assumptions or predictions are inaccurate, or if structural or operational
2 problems arise.

3
4 **Sensitivity Analysis**-If the findings of the risk and uncertainty analysis indicate a
5 significant level of risk or uncertainty associated with parameters of certain alternative
6 plans, a sensitivity analysis should be performed. A sensitivity analysis will help to
7 estimate the magnitude of the effect on plan performance that a change of a given
8 parameter would make. If, for example, a slight change in ecological relationships would
9 result in a huge difference in project performance, the PDT should document this fact.

10 11 **4. Recreation Analysis**

12 Determine effects of the selected alternative plan on existing recreation facilities and
13 consider additional recreation opportunities in the study area. As appropriate, formulate
14 and evaluate additional recreation features in accordance with USACE regulations and
15 policy.

16 17 **D. Plan Selection Process**

18
19 Document how the selected alternative plan was selected from the final array
20 of alternative plans. Document the results of cost effectiveness/incremental
21 cost analyses (CE/ICA) and other significant conclusions resulting from
22 comparison of the final array of alternative plans. Describe selection criteria
23 used and how the criteria reflect the planning objectives and performance
24 measure targets. Explain how selection criteria were applied. The tentatively
25 selected plan will be the plan that reasonably optimizes net benefits, both
26 monetary and non-monetary, consistent with the objectives of the Plan.

27
28
29 **Integration of Planning Objectives and Performance Measures**-Establish and set
30 values for selection criteria for selection of the plan from the final array of alternative
31 plans. Criteria may include such things as achievement of planning objectives, the degree
32 of risk or uncertainty that is acceptable, achievement of performance measure targets and
33 the necessity of undesirable trade-offs. Explain how the criteria were applied and how
34 each alternative plan was rated. Tables or charts may be helpful to display information to
35 aid this analysis.

36
37 **Other Criteria Considered for Plan Selection**-Document any other criteria used to
38 choose the selected alternative plan. Such criteria will be unique to each project but may
39 include such things as achievement of Principles and Guidelines criteria, Environmental
40 Operating Principles, land availability, public preference, achievement of interim goals
41 and interim targets, incidental benefits, mitigation requirements, or compatibility with
42 other CERP or C&SF Project system features.

43
44 **Justification**-In addition to USACE requirements for project justification, the PIR must
45 demonstrate that each project is justified on a NAI basis. Document benefits if this
46 increment were the last one implemented, in addition to those already authorized. Include

1 an analysis of NAI (Guidance Memorandum #2 provides additional information on the
2 NAI), system-wide benefits, and achievement of approved system-wide performance
3 measures and targets.
4

5 **III. DESIGN SELECTED PLAN**

6

7 **A. Selected Alternative Plan Description**

8

9 **Selected Alternative Plan Features and Actions**-Document in technical detail the
10 specific features of the selected alternative plan. Develop a clearly labeled project
11 drawing and map showing the project location and context. Develop other graphics,
12 charts or photographs necessary to provide a clear and accurate understanding of the
13 selected alternative plan's features.
14

15 **Selected Alternative Plan's Contribution Towards Achieving CERP Goals and**
16 **Purposes**-Show how the selected alternative plan is an integral part of the Plan and
17 document the selected alternative plan's contribution to achievement of the goals and
18 purposes of the Plan.
19

20 **Selected Alternative Plan's Contribution to Achievement of Interim Goals and**
21 **Interim Targets**-Document how the selected alternative plan contributes to the
22 achievement of interim goals and the interim targets established according to the
23 Programmatic Regulations.
24

25 **Relationship to Problems and Opportunities Statements**-Demonstrate that the selected
26 alternative plan effectively addresses the problem and opportunity statements developed
27 earlier in the planning process.
28

29 **Relationship to Planning Objectives and Constraints**-Show the relationship of
30 selected alternative plan to the planning objectives and constraints.
31

32 **Develop Initial Operating Regime (IOR)**-Document the assumptions concerning the
33 initial operating regime and how those assumptions were used in development of the
34 Project Operating Manual.
35

36 **Project Operating Manual**-Provide summary information from the Draft POM that is
37 included as an annex to the PIR. The Draft POM should be based on the Initial Operating
38 Regime and will include conceptual discussion of the operational intent and transitioning
39 from the Initial Operating Regime to subsequent operations as system conditions change
40 or as constraints are removed. The Draft POM should include appropriate operating
41 parameters, (e.g. special guidance or constraints) that are necessary to achieve the
42 performance of the project, particularly natural system performance. Refer to Guidance
43 Memorandum #5 for additional guidance on Operating Manuals.
44

45 **Project Monitoring Plan**-Determine the monitoring activities that will be conducted for
46 the selected alternative plan.

1
2 **Selected Alternative Plan Costs**-Provide a general breakdown of all the costs associated
3 with the selected alternative plan. Include costs for: construction; lands, easements,
4 relocations, rights-of-way and disposals (LERRDs); Operation, Maintenance, Repair,
5 Rehabilitation, And Replacement (OMRR&R); and project monitoring.
6

7 **Permits, Entitlements, and Certifications**-Determine the necessary permits,
8 certifications, and entitlements that are required to construct and implement the selected
9 alternative plan. Determine any actions taken to begin the procurement or application
10 processes for such permits and certifications. Determine actions still to be taken.
11

12 **Mitigation and Environmental Commitments**-Document any commitments that have
13 been made by any agency in order to implement the selected alternative plan. Describe
14 the specific mitigation actions that may be required to implement the selected alternative
15 plan. Show that the mitigation is justified. The resources for which mitigation is required
16 should also be described clearly.
17

18 **Compliance with Environmental Laws, Statutes, Executive Orders**-Identify how each
19 applicable law, statute and executive order is being complied with and or the status of the
20 compliance.
21

22 **B. Project Assurances**

23
24 *Address Federal and State requirements unique to CERP PIRs as required by*
25 *section 601 of WRDA 2000, the Programmatic Regulations, and State*
26 *Statutes.*
27

28
29 **Elimination or Transfer of Existing Legal Sources of Water**-Determine if
30 implementation of the selected alternative plan would result in the elimination or transfer
31 of an existing legal source of water (section 385.36[a] of the Programmatic Regulations).
32 Guidance Memorandum #3 provides further guidance on how to conduct these analyses.
33

34 **Project Effects on Level of Service for Flood Protection**-As required by the Savings
35 Clause of section 601(h)(5) of WRDA 2000, appropriate analyses must be conducted to
36 demonstrate that the levels of service for flood protection that: (1) were in existence on
37 the date of enactment of WRDA 2000; and (2) are in accordance with applicable law, will
38 not be reduced by implementation of the project. Guidance Memorandum #3 provides
39 details on how to conduct this evaluation.
40

41 **Identification of the Water Made Available by the Project and the Water to Be**
42 **Reserved or Allocated**-Guidance Memorandum #4 provides a detailed discussion of: 1)
43 the total water necessary to achieve the benefits of the project; 2) the identification of the
44 water made available by the project; and 3) identification of the amount of water to be
45 reserved or allocated for the natural system.
46

1 **Compliance with Applicable Water Quality Standards and Permitting**
2 **Requirements**-The FDEP is responsible for issuing Water Quality Certification (WQC)
3 and/or State permits for CERP Projects. The PDT should work to provide as much detail
4 as possible about the construction and operation of the selected alternative plan to
5 facilitate timely issuance of the WQC and/or State permits.
6

7 **Compliance with Florida Statutes** Section 373.026(8)(b), F.S., requires that prior to
8 submitting a PIR to Congress for authorization or receipt of an appropriation of State
9 funds for construction of a CERP project, the FDEP must first approve the project
10 component. Section 373.470, F.S., requires that, prior to executing a PCA with the
11 USACE, a PIR must contain sufficient information to receive FDEP approval under
12 section 373.026(8)(b), F.S. In order to receive approval of the project component by the
13 FDEP, the SFWMD must provide documentation to demonstrate compliance with the
14 criteria set forth in section 373.1501(5), F.S.
15

16 **C. Implementation of the Selected Plan**

17
18 **Schedule**-Determine the timeline for implementing the features of the selected alternative
19 plan, explain any relationship between the implementation of the different components
20 (e.g., dependencies) and describe any specific time-of-year requirements associated with
21 any features of the selected alternative plan.
22

23 **Costs: Engineering and Design, Construction, LERRDS, OMRR&R**-Determine all
24 the costs associated with implementation of the selected alternative plan.
25

26 **Cost-Sharing**-Determine the cost allocation for the selected alternative plan over the
27 duration of the implementation period between the USACE and non-Federal sponsor(s).
28 If cost-sharing of water quality features is recommended, then cost-sharing should be
29 explicitly stated here. Such statements must also show that any features to improve water
30 quality are implemented in a manner consistent with the cost-sharing provisions in
31 section 528 of WRDA 1996 and section 601 of WRDA 2000.
32

33 **Summary of Federal/Non-Federal Implementation Responsibilities**-Based on the
34 schedule and costs reflected for the selected alternative plan, determine each party's
35 responsibilities for implementation. This will include the Federal and non-Federal
36 sponsors, and will sometimes also include other agencies.
37

38 **Unresolved External Issues**-Document the unresolved external constraints and factors,
39 if any, that may affect project implementation (e.g., land use, land ownership and
40 management issues) as well as other risk factors for the project. Present any issues that
41 are outside the purview of the USACE or non-Federal sponsor's authority, including
42 issues discussed but determined to not be relevant to the project purpose.

*COVER PAGE AND ABSTRACT

*EXECUTIVE SUMMARY

- PIR Summary
- Major Conclusions and Findings
- Areas of Controversy
- Unresolved Issues

TABLE OF CONTENTS

1.0 INTRODUCTION

- 1.1 Report Authority
- 1.2 Project Area
- 1.3 Purpose and Scope
- 1.4 Prior Studies, Reports, and Projects

2.0 *EXISTING CONDITIONS/AFFECTED ENVIRONMENT

- 2.1 Existing Conditions of the Area
- 2.2 Environmental Setting of the Area
- 2.3 Significant Resources

3.0 *FUTURE “WITHOUT PROJECT” CONDITION

- 3.1 Forecast of Future Conditions

4.0 IDENTIFICATION OF PROBLEMS AND OPPORTUNITIES

- 4.1 Public Concerns
- 4.2 Problems and Opportunities
- 4.3 Planning Objectives and Constraints

5.0 *FORMULATION OF ALTERNATIVE PLANS

- 5.1 Project Evaluation Criteria, Performance Measures, and Evaluation Methods and Models
- 5.2 Prior Formulation from the “Yellow Book”
- 5.3 Plan Formulation Rationale
- 5.4 Management Measures and Preliminary Plans
- 5.5 Final Array of Alternatives
- 5.6 Comparison of Alternatives
- 5.7 Plan Selection
- 5.8 Risk and Uncertainty

1	6.0 *THE SELECTED PLAN
2	6.1 Description of Plan Components
3	6.2 Recreation Components
4	6.3 Cost Estimate
5	6.4 Design and Construction Considerations
6	6.5 LERRD Considerations
7	6.6 Operations and Maintenance Considerations
8	6.7 Plan Accomplishments
9	6.8 Contribution to Achievement of Interim Goals and Targets
10	6.9 Summary of Economic, Environmental, and Other Social Effects
11	
12	7.0 *ENVIRONMENTAL EFFECTS
13	7.1 Environmental Evaluation Methodology
14	7.2 Effects on Significant Resources
15	
16	8.0 PLAN IMPLEMENTATION
17	8.1 Institutional Requirements
18	8.2 Division of Implementation Responsibilities
19	8.3 Cost Sharing
20	8.4 Project Operations
21	8.4.1 Initial Operating Regime
22	8.4.2 Future Operations
23	8.5 Project Assurances
24	8.5.1 Effects on Existing Legal Sources of Water
25	8.5.2 Effects on Level of Service for Flood Protection
26	8.5.3 Identification of Water Made Available
27	8.5.4 Identification of Water to be Reserved or Allocated for the Natural System
28	8.6 Project Monitoring Plan
29	8.7 Compliance with Environmental Laws, Statutes, and Executive Orders
30	8.8 Compliance with Florida Statutes
31	8.9 Views of Non-Federal Sponsor

37 * Elements marked with an asterisk (*) are required for NEPA compliance according
38 to CEQ Regulations.

39

1 **SECTION 2: GUIDANCE MEMORANDUM #2**
2 **FORMULATION AND EVALUATION OF ALTERNATIVES FOR**
3 **PROJECT IMPLEMENTATION REPORTS**
4
5

6 **2.1 PURPOSE**
7

8 The Programmatic Regulations require that a Guidance Memorandum be developed to
9 “describe the processes to be used to formulate and evaluate alternative plans and their
10 associated monetary and non-monetary benefits and costs, determine cost-effectiveness and
11 optimize the project’s contributions towards achieving the goals and purposes of the Plan,
12 and the basis for justifying and selecting an alternative plan to be recommended for
13 implementation...” and “... provide a process for evaluating projects that are outside the
14 boundary of regional computer models or projects whose effects cannot be captured in
15 regional computer models.”
16

17 In addition, the Programmatic Regulations include other provisions related to formulation
18 and evaluation that need to be addressed in this Guidance Memorandum. These areas
19 include:

- 20 • Describing a process for including each alternative plan with all the other components
21 of the plan;
- 22 • Evaluating the total monetary and non-monetary benefits and costs of the resulting
23 comprehensive plan when compared to the without CERP condition; and
- 24 • Describing the process for identifying the tentatively selected plan, as well as
25 evaluating the tentatively selected plan as the NAI.
26

27 This Guidance Memorandum provides information about the formulation and evaluation of
28 alternatives for PIRs.
29

30 **2.2 APPLICABILITY**
31

32 This Guidance Memorandum applies to PIRs for all CERP projects and provides additional
33 information on the plan formulation and evaluation activities described in Guidance
34 Memorandum #1. There may be differences in the level of detail included in each PIR based
35 on specific situations. For example, the amount of detail necessary to complete the
36 formulation and evaluation for the PIR, the extent of previous formulation, the planning
37 research activities, and/or the design detail may differ from project to project.
38

39 **2.3 UPDATING GOALS, PROBLEMS AND OPPORTUNITIES, AND**
40 **PLANNING OBJECTIVES AND CONSTRAINTS**
41

42 As described in Guidance Memorandum #1, the initial step in the PIR process, developing
43 base conditions and models, involves reviewing and collecting the project information from
44 the contextual setting of CERP. Goals, problems and opportunities, and planning objectives
45 and constraints should be directly taken from the Plan. Upon completion of scoping with

1 agencies and the public on the previously developed criteria, the PDT should identify any
2 new issues and conditions that may require additional goals, problem and opportunity
3 statements, or planning objectives and constraints for the project. RECOVER should be
4 consulted regarding any additional problems and opportunities that may have been identified
5 related to the project on a system-wide basis. In developing any new evaluation criteria, it is
6 incumbent on the PDT to ensure that the new evaluation criteria still meet the intent of the
7 Plan.

9 **2.4 PERFORMANCE MEASURES**

10
11 The basic goal of CERP is to restore the South Florida ecosystem by providing more natural
12 timing, flows, depths, and distribution within the natural system, while providing for other
13 water-related needs of the region. Evaluation criteria and ecological performance measures
14 that are used in the PIR process should promote more natural hydrology and optimize
15 ecological benefits, consistent with the specific goals and planning objectives of the projects.
16 To evaluate system-wide effects of projects, the system-wide performance measures
17 developed by RECOVER should be used to the greatest extent possible.

18
19 Depending on the scale of the project and the scope of formulation, project-level evaluation
20 criteria and performance that are consistent with the RECOVER system-wide performance
21 measures should be identified and developed as necessary. Project-level performance
22 measures developed by the PDT will be reviewed by RECOVER for consistency with the
23 system-wide performance measures. Any disagreements between RECOVER and the PDT
24 on performance measures will be elevated to appropriate agency management. The set of
25 performance measures (system-level and project-level) that are proposed to be used will be
26 discussed and approved at the FSM meeting.

27
28 Alternative plans will be evaluated and compared by calculating each alternative's outputs or
29 benefits, both monetary and non-monetary, using appropriate NER outputs. A complete
30 discussion of NER evaluation may be found in USACE guidance such as ER 1105-2-100.
31 Benefits should be based on metrics that can be assessed as well as predicted, and that are
32 consistent with RECOVER performance measures used in evaluation, assessment and
33 development of the interim goals and interim targets. Performance measures are a subset of
34 the broader set of evaluation criteria. Those performance measures can be used to formulate
35 and evaluate alternative plans and are quantifiable measures of how well a project meets
36 defined hydrological or ecological targets. Performance measures are used in both the
37 planning phase and in post-construction monitoring and assessment of a project. Displays of
38 alternative plans showing the key performance measures and evaluation criteria that are used
39 in the plan formulation and evaluation process should be included in the Plan Formulation
40 and Evaluation Appendix of the PIR.

41
42 Because CERP projects are required to be selected and justified based on their system-wide
43 benefits, the evaluation process should be based on the system-wide performance measures
44 developed by RECOVER. In addition to system-wide performance measures, the PDT may
45 develop project-specific performance measures, if necessary, to capture localized alternative
46 effects.

1
2 Performance measures should be linked to project goals and planning objectives and to the
3 overall goals and purposes of CERP. A good set of performance measures will have the
4 following attributes:

- 5 • For the natural system, they should be based on the conceptual ecological models
- 6 • For other water-related needs, they should be related to defined project objectives;
- 7 • Should include effects of hydrology and flow;
- 8 • Cover the full range of potential effects of a plan on the project’s planning objectives;
- 9 • Include only measures that are necessary;
- 10 • Be supported by best-available scientific and technical information; and
- 11 • Be specific and sensitive enough to differentiate between alternative plans.

12
13 If project-level performance measures are developed, RECOVER will conduct a review of
14 the project-level performance measures for consistency with the system-wide performance
15 measures. The PDT and RECOVER need to ensure that the targets are generally supported
16 by the scientific literature or legal requirements.

17
18 Further, information from the U.S. Fish and Wildlife Service’s Planning Aid Letters (PALs)
19 and Fish and Wildlife Coordination Act reports (CARs), the scientific literature, and
20 scientific peer review will be used to assist in defining project benefits. Collaboration with
21 appropriate agency partners will also be maintained in the process of developing such
22 metrics.

23 24 **2.4.1 Performance Measures for the Natural System**

25
26 Performance measures for the natural system should be based on restoring more natural
27 timing, flows, depths, and distribution as described in the conceptual ecological models that
28 have been developed for the south Florida ecosystem. The use of conceptual ecological
29 models is a key element of the Applied Science Strategy, as described in Guidance
30 Memorandum #6, and a primary foundation for the development of CERP performance
31 measures. Conceptual ecological models illustrate the links among societal actions,
32 environmental stressors and ecological responses; describe the major causal hypotheses that
33 explain why the natural systems in south Florida have been altered; and document the
34 scientific rationale for the management actions undertaken to restore these systems (Gentile
35 et al., 2001). Conceptual ecological models have guided the development of RECOVER’s
36 system-wide performance measures, the interim goals for the natural system, and the CERP
37 MAP. The MAP provides documentation for the conceptual ecological models developed to
38 date as well as additional information about their application in CERP.

39
40 The Plan was formulated to improve the quantity, quality, timing, and distribution of water to
41 the natural system – in short, “getting the water right.” Performance measures for the natural
42 system should be linked to hydrologic changes that are necessary to “get the water right.”
43 The set of performance measures for the natural system should include such measures as
44 monthly, seasonal, and inter-annual changes in flow. Consistent with conceptual ecological
45 models and best available science, durations and frequencies of extreme events (too much or
46 too little water) should also be included in the set of performance measures. It is particularly

1 important to have performance measures that show the frequency and duration of too much
2 water in natural areas since the Savings Clause analyses concerning reductions in the level of
3 service for flood protection are not applicable to natural areas. Graphic displays, such as
4 Figure 5-D-9, should be developed to show progress toward meeting a more natural
5 hydrology and flow, on a monthly, seasonally and interannual basis.¹. Additionally, other
6 project specific graphics may be necessary for some projects to fully evaluate whether the
7 project is redistributing water as intended.

8
9 In addition to the system-wide performance measures, additional ecological and hydrologic
10 performance measures for the natural system may be developed and applied as needed. All
11 performance measures should be reviewed by RECOVER prior to use in the formulation and
12 evaluation process. To support project assessment and adaptive management, a single
13 integrated set of performance measures with both predictive (evaluation) and assessment
14 elements should be used for system-wide tasks including project alternative evaluation,
15 assessments, and interim goals and interim targets.

17 **2.4.2 Performance Measures for Urban and Agricultural Water Supply and** 18 **Flood Protection**

19
20 The CERP system-wide performance measures integrate multiple performance measures to
21 evaluate the effects of projects on urban and agricultural water supply, flood protection, and
22 resource protection. The PDT should use these performance measures as appropriate or
23 develop additional measures to gauge the effects of the project on the ability to supply water
24 for urban and agricultural users or continue providing flood protection. If project
25 performance measures are developed, then those performance measures should be linked to
26 State and Federal laws and policies (e.g. the State level of certainty planning goal for water
27 supply is based on meeting needs in a 1 in 10 drought event) and be consistent with the
28 natural system performance measures developed for the project. All performance measures
29 should be reviewed by RECOVER prior to use in the formulation and evaluation process.

31 **2.5 PERIOD OF ANALYSIS**

32
33 The Plan was based on a 50-year period of analysis and a planning horizon to the year 2050.
34 The period of analysis for calculating the benefits and associated costs for a project will
35 begin the year in which the project will be functional (base year). The end-point for the
36 period of analysis used in a PIR will coincide with the period of analysis end-point used in
37 the most current version of the Plan (i.e., the April 1999 “Final Integrated Feasibility Report
38 and Programmatic Environmental Impact Statement” used 2050). This end-point consistency
39 is necessary for the proper calculation of system-wide benefits. The PDT should note that
40 this could result in a period of analysis shorter than 50 years. As periodic CERP updates are
41 completed in accordance with section 385.31(c) of the Programmatic Regulations, the end-
42 point for the period of analysis will be revised to reflect the new condition.

¹ At the time this Guidance Memoranda was being developed, RECOVER was in the process of formulating performance measures for flow. Until such time as flow performance measures are approved, the PDT should develop graphic displays showing flow performance as represented in Figure 5-D-9.

1 **2.6 CONSIDERATION OF AVAILABILITY OF PRE-CERP**
2 **BASELINE WATER AND EXISTING WATER RESERVATIONS**
3 **OR ALLOCATIONS**
4

5 Section 385.35(b)(2) of the Programmatic Regulations requires that:

6
7 “Each PIR shall take into account the availability of Pre-CERP Baseline water and
8 previously reserved water as well as the estimated total quantity of water that is
9 necessary for restoration for the natural system and the quantity of water anticipated
10 to be made available from future projects in identifying the appropriate quantity,
11 timing, and distribution of water dedicated and managed for the natural system,
12 determining whether improvements in water quality are necessary to ensure that
13 water delivered to the natural system meets applicable water quality standards; and
14 identifying the amount of water for the natural system necessary to implement, under
15 State law, the provisions of section 601(h)(4)(A)(iii)(V) of WRDA 2000.”
16

17 The Pre-CERP Baseline is a description of assumed hydrologic conditions on the date of
18 enactment of WRDA 2000 (December 11, 2000). The PDT will compare the Existing
19 Conditions Baseline to the Pre-CERP Baseline to determine if there are changes in baseline
20 water availability. The results of this comparison will be used in project formulation and
21 evaluation. If the Pre-CERP Baseline water is no longer available for the natural system, then
22 the PDT may consider such things as:

- 23 • Developing alternatives that capture additional water; or
 - 24 • Changes in system operations to increase the amount of water made available to the
25 natural system.
- 26

27 More detailed information regarding the Pre-CERP Baseline is contained in Guidance
28 Memorandum #3 and in the Pre-CERP Baseline document.
29

30 During the initial phase of plan formulation, the PDT must identify if any existing
31 reservations or allocations of water made under State law need to be considered. The PDT
32 must use the information related to the approved performance measures and associated
33 targets from modeling for the existing reservations or allocations made by the State to aid in
34 the identification of water made available for the natural system by the project (See Guidance
35 Memorandum #4).
36

37 **2.7 SCREEN ALTERNATIVE PLANS FOR EFFECTS ON**
38 **EXISTING LEGAL SOURCES OF WATER AND LEVELS OF**
39 **SERVICE FOR FLOOD PROTECTION**
40

41 The PDT should perform a preliminary screening analysis for the final array of alternatives to
42 determine potential effects on existing legal sources of water and levels of service for flood
43 protection. The PDT should identify a subset of evaluation criteria correlated to existing legal
44 sources of water and flood protection considerations; however, alternative plans should be
45 primarily evaluated and compared based on the benefits produced by each plan. If there are

1 trade-offs in performance for natural areas that need to be considered, those trade-offs should
2 be evaluated and justified as part of the formulation and evaluation process. Any
3 disagreements on trade-offs will be elevated to appropriate agency management. A Savings
4 Clause analysis for existing legal sources of water and flood protection will be conducted on
5 the selected alternative plan (see Guidance Memorandum #3).

7 **2.8 CONSIDERING CHANGES TO OPERATIONS OUTSIDE OF** 8 **THE PROJECT AREA**

9
10 The PDT should consider including, as appropriate, changes to operations in other areas of
11 the system in order to optimize the delivery of system benefits. For example, changes to the
12 WCA regulation schedules should be considered for projects, such as the Everglades
13 Agricultural Area Storage Project, which are designed to improve the natural hydrology in
14 the Water Conservation Areas and Everglades National Park. Changes to operations should
15 be considered if there would be a direct beneficial impact to the project. Whenever possible,
16 the PDT should incorporate Everglades Rainfall Driven Operations (ERDO) in the project
17 being formulated to the greatest extent possible without creating harm elsewhere. The PIR
18 should contain a discussion of the incorporation of ERDO into the project.

19 20 **2.9 TRADE-OFF ANALYSIS**

21
22 Trade-off analysis is the procedure to identify the potential gains and/or losses associated
23 with producing a larger or lesser amount of a given output or outputs. The PDT will identify
24 and analyze potential trade-offs as part of the formulation and evaluation process. The results
25 of trade-off analysis are to be displayed in the PIR.

26 27 **2.10 RISK AND UNCERTAINTY ANALYSIS**

28
29 The PDT will identify areas of risk and uncertainty in the team's analysis and describe those
30 risks and uncertainties clearly, so that decisions can be made with the knowledge of the
31 degree of reliability of the estimated benefits and costs and of the effectiveness of the
32 selected alternative plan. When the costs and outputs of alternate plans are uncertain and/or
33 there are risks that outcomes will not be achieved, the identification of a selected alternative
34 plan becomes more complex. Documentation of the assumptions made and uncertainties
35 encountered during the course of planning analysis is essential. Some activities may have
36 relatively low risk while other activities may have higher risks. When identifying the selected
37 alternative plan, the associated risk and uncertainty of achieving the proposed level of
38 outputs must be considered. For uncertainties that may significantly affect project
39 performance, the PDT should conduct sensitivity analyses or scenario modeling. Adaptive
40 management (Guidance Memorandum #6) provides a means for addressing uncertainty in
41 ecosystem responses.

42 43 **2.11 FORMULATION AND EVALUATION FOR THE PIR**

44
45 While the PIR has many aspects of a USACE Feasibility Study, the primary difference with
46 the PIR is the steps taken to complete plan formulation and evaluation of the project. Unlike

1 a feasibility study, the PIR is based on a component or components that have previously been
 2 formulated to a certain level in developing the Plan and are expected to accomplish specific
 3 Plan goals. As such, formulation in the PIR always begins with the formulation already
 4 documented in the Plan. The formulation and evaluation process and its relation to other
 5 major tasks for the PIR is depicted in Figure 2-2.
 6
 7

8
 9
 10 **Figure 2-2: Relationship between Formulation and Evaluation and Other**
 11 **PIR Tasks**
 12
 13

14 During the development of the base conditions and models (Guidance Memorandum #1) for
 15 the PIR, the PDT should extract the relevant information from the Plan documents. In
 16 addition, the project described in the Plan should be reviewed and cost information updated
 17 based on available information. The PDT should conduct an initial screening effort to
 18 determine if the project as described in the Plan will still achieve the benefits of the project as
 19 described in the Plan in a cost-effective manner. The results of this initial screening effort
 20 will be presented at the FSM with the USACE vertical team and the Office of the Assistant
 21 Secretary of the Army for Civil Works (OASA(CW)) to determine if the project plan
 22 formulation process will entail optimization of the project described in the Plan or if
 23 formulation of additional alternatives will be necessary.
 24

25 If the project as described in the Plan will still achieve the benefits of the project as described
 26 in the Plan in a cost-effective manner, then the PDT's efforts will focus on development of
 27 design alternatives and optimization of the project features, cost-effectiveness, satisfaction of
 28 Programmatic Regulations requirements for PIRs, M-CACES cost estimates, and the
 29 integrated NEPA documentation to supplement the information contained in the
 30 Programmatic Environmental Impact Statement (PEIS) for the Plan, in accordance with the
 31 concept of tiering under NEPA.
 32

33 If the project described in the Plan no longer achieves the benefits of the project as described
 34 in the Plan, additional formulation will be required to develop a justifiable alternative.
 35 However, the formulation completed and described in the Plan will provide the foundation
 36 for the PDT to formulate additional alternatives. The new or changed circumstances
 37 requiring additional formulation should be documented. As noted previously, for those

1 projects where the non-Federal sponsor has already acquired lands, the PIR will use the
2 actual cost of the land bought for the project instead of the estimated value of the land.
3 Additional management measures to address the new circumstances should be developed and
4 screening should occur based on the project's evaluation criteria and approved performance
5 measures. From the screening process additional alternatives will be formulated.
6

7 If formulation of additional alternatives is necessary, then the PDT will formulate additional
8 alternatives by developing management measures at different scales or sites to meet the
9 project's goals and purposes.
10

11 In both cases, either when a project is further optimized in a PIR or when additional
12 formulation is needed, evaluations should be conducted on a system-wide basis in the context
13 of the rest of the Plan using regional modeling tools such as the SFWMM when possible.
14 Evaluation of system-wide effects of alternative plans conducted using regional models will
15 be supported by RECOVER. The PDT should involve RECOVER as early as possible in the
16 plan formulation process, including at the FSM, so that a system-wide perspective is
17 maintained throughout the process.
18

19 In some cases, a project is hydrologically separate from the C&SF Project (see Attachment 1-
20 A of Guidance Memorandum #1) or the regional model cannot capture the project's effects.
21 In those cases, any necessary formulation and evaluation will utilize sub-regional or site-
22 specific models that focus on more localized project outputs. Project performance measures
23 will provide the link to describing system-wide benefits of the project.
24

25 **2.11.1 Acceler8 Projects**

26
27 The State of Florida has approved a SFWMD plan called "Acceler8" for the purpose of
28 accelerating design and construction of a number of important restoration projects consistent
29 with the Comprehensive Everglades Restoration Plan (CERP) but prior to one or more of the
30 following: Administration approval, congressional committee resolution, congressional
31 authorization, or federal construction funding. The State anticipates the Acceler8 program
32 will provide immediate environmental, social, and economic benefits in the South Florida
33 region.
34

35 For each PIR that includes an Acceler8 project, the Acceler8 project will be analyzed as one
36 of the alternative plans considered or the Acceler8 project should be encompassed within at
37 least one of the alternatives considered in the PIR. If the selected alternative plan for the PIR
38 includes the features proposed to be constructed by the SFWMD under the Acceler8
39 program, then those Acceler8 features should be identified to be implemented as the first
40 phase of construction of the selected alternative plan.
41

42 **2.11.2 Plan Formulation and Evaluation Procedure**

43
44 The formulation and evaluation approach for CERP considers the system-wide
45 interdependencies of CERP projects. The formulation and evaluation procedure includes four
46 steps: 1) system formulation and evaluation; 2) cost-effectiveness and ICA; 3) identification

1 of the tentatively selected plan; and 4) next-added increment analysis. These steps are
2 described in more detail in the following paragraphs.

3 4 **2.11.2.1 Step 1: System Formulation and Evaluation**

5
6 Once the level of formulation necessary for the PIR has been determined, the PDT will
7 initiate the formulation and evaluation process for the PIR. The PDT will formulate and
8 evaluate alternatives to achieve the goals and purposes of the project, to optimize net
9 benefits, both monetary and non-monetary, on a system-wide basis, and to achieve the
10 benefits of the Plan. The Plan was formulated to improve the quantity, quality, timing, and
11 distribution of water to the natural system, while providing for other water-related needs of
12 the region – in short, “getting the water right.” Performance measures for the natural system
13 should be based on the conceptual ecological models that have been developed for the south
14 Florida ecosystem. A key sub-set of the performance measures should be identified. This key
15 sub-set of the performance measures will be the primary means to ensure that the goals and
16 purposes of the project are achieved. To evaluate system-wide effects of projects, the system-
17 wide performance measures developed by RECOVER should be used to the greatest extent
18 possible. Depending on the scale of the project and the scope of formulation, project-level
19 evaluation criteria and performance that are consistent with the RECOVER system-wide
20 performance measures should be identified and developed.

21
22 The PDT is responsible for development of the set of alternative plans to be considered. For
23 those projects where the formulation effort is to focus on optimization of the project
24 described in the Plan, the PDT will develop various configurations. For those projects where
25 formulation of additional alternatives is necessary, the PDT will consider different measures,
26 components, features, and project scales within the study area to achieve the planning
27 objectives and to achieve the benefits of the project described in the Plan. In accordance with
28 the Programmatic Regulations, the initial alternative to be considered by the PDT will be the
29 project as defined in the Plan. While new information and implementation of other CERP
30 components may show that this is an unrealistic alternative for consideration, evaluation of
31 this alternative is required to demonstrate the differences between the approved Plan and the
32 alternatives being considered. For each PIR that encompasses an Acceler8 project, the
33 proposed Acceler8 project will be analyzed as one of the alternative plans considered or
34 encompassed within the alternatives considered in the PIR.

35
36 Although the PDT will be formulating and evaluating projects individually to achieve the
37 benefits of the Plan as part of the planning process, the selected plan should optimize net
38 benefits, both monetary and non-monetary, on a system-wide basis. The PDT, in
39 coordination with RECOVER, will evaluate system-wide effects of alternatives. The PDT
40 will use these system-wide benefits as the basis for project justification.

41
42 In accordance with the Programmatic Regulations, the evaluation of alternatives involves the
43 comparison of the Future With Project Condition to the Future Without CERP Baseline. For
44 this purpose, the Future With Project Condition for an alternative plan will be built from the
45 Future Without CERP Baseline and include all of the other projects of the Plan (authorized
46 and not yet authorized) along with the alternative plan being evaluated. This will result in a

1 system-wide “comprehensive plan” that can be compared to the Future Without CERP
2 Baseline.

3 4 **2.11.2.2 Step 2. Cost-Effectiveness and Incremental Cost Analysis (CE/ICA)**

5
6 The second step in the formulation and evaluation process is to perform cost-effectiveness
7 and incremental cost analyses (CE/ICA). A discussion of the metric that is used to conduct
8 cost-effectiveness and ICA should be provided. This will include a summary of the
9 ecological outputs and benefits as well as benefits to other water-related needs based on
10 performance measures and a description of improvements to significant resources, including
11 progress towards meeting more natural hydrology and flow. A discussion of the system-wide
12 benefits of the alternatives should be included. In some cases, the PDT may not have tools
13 available that adequately capture differences in outputs between alternative plans,
14 particularly when considering design optimization alternative plans. In this case, the cost-
15 effectiveness analysis is the critical analysis in selecting an alternative plan. Incremental cost
16 analysis (ICA) would not be necessary, or would be limited to demonstrating the efficiency
17 (cost per unit of output) of each alternative plan. If available tools are able to capture
18 differences in outputs between alternative plans, an ICA should be conducted. The ICA
19 demonstrates the increase in cost required for each additional unit of output. Only cost-
20 effective alternative plans that demonstrate viable benefits should be retained for further
21 analysis.

22 23 **2.11.2.3 Step 3: Identification of Tentatively Selected Plan**

24
25 The third step of the formulation and evaluation process is the identification of the tentatively
26 selected plan. This step is performed after consideration of the various alternative plans,
27 alternative plan effects, public comments, and success in meeting Federal, State, and other
28 requirements. In this final iteration of the planning process, the final array of alternatives is
29 presented. This group will also include the no-action plan. These alternatives are
30 representative of those alternatives that have made it through all previous iterations of
31 formulation, screening, and evaluation. In addition, the alternatives have been assessed to
32 comply with the Principles and Guidelines (complete, effective, efficient, and acceptable) as
33 well as with NEPA requirements. Any of the alternatives in this final array provide a feasible
34 option for implementation, meeting the intended goals and planning objectives of the PIR.
35 The tentatively selected plan will be the plan that reasonably optimizes net benefits, both
36 monetary and non-monetary, consistent with the objectives of the Plan. Once a tentatively
37 selected plan is identified, the next-added increment (NAI) analysis described in the next
38 section must be conducted.

39 40 **2.11.2.4 Step 4: Next-Added Increment Analysis**

41
42 The Programmatic Regulations require evaluation of the tentatively selected plan as the
43 “next-added increment” (NAI). The NAI analysis evaluates the effects, or outputs, of the
44 tentatively selected plan as the next project to be added to the group of already approved
45 CERP projects. This analysis helps illuminate the beneficial effects the selected alternative
46 plan contributes without regard to future CERP projects as well as the importance of the

1 project in the sequence of implementing CERP and dependence of other CERP projects on
2 the project under evaluation. The analysis also helps to ascertain whether sufficient benefits
3 would be attributable to the tentatively selected plan to justify the cost, if no additional CERP
4 projects (other than those already existing or authorized) were implemented.

5
6 The PDT will conduct the NAI analysis on the tentatively selected plan and display the
7 results so that the justification of the tentatively selected plan may be demonstrated. The NAI
8 analysis will use a comparison of the with project condition to the without project condition.
9 For this analysis, the with project condition is the NAI Condition and the without project
10 condition is the NAI Baseline. The comparisons should be made at appropriate time-points
11 (e.g., implementation base year, period of analysis end-point) to determine average annual
12 benefits or their equivalent. The tentatively selected plan must be justified on a NAI basis.
13 The PDT should note that the NAI Baseline, which only includes those CERP projects that
14 have already been approved, is synonymous with the no-action alternative for the PIR, which
15 is different than the Future Without CERP Baseline. The model runs used for the NAI
16 analysis should be operationally optimized.

17
18 The spatial extent of system-wide and project-level effects must be identified to quantify
19 beneficial effects of a project. One of the underlying principles of CERP is to capture and
20 store excess flows and discharges currently made to tide to restore some of the historic
21 regional water storage function that has been lost through the implementation of drainage and
22 flood control infrastructure and development in the region. Since the projects that comprise
23 CERP are designed to work together to achieve the system-wide (i.e., pertaining to the C&SF
24 Project or the South Florida ecosystem, as a whole) goals and purposes of CERP, in most
25 cases, non-monetary benefits for the natural system or other water-related needs should be
26 conducted on a system-wide basis in addition to a project-level basis.

27
28 The PDT may demonstrate NAI justification by:

- 29 • quantifying environmental and economic benefits attributable to the tentatively
30 selected plan in the absence of other not-yet-approved CERP projects;
- 31 • demonstrating the dependency of environmental and economic benefits of CERP on
32 the tentatively selected plan;
- 33 • describing the project's role to enable already approved CERP projects to function
34 and provide benefits;
- 35 • demonstrating the relationship of other CERP projects and planning constraints (such
36 as the Savings Clause) to the tentatively selected plan; or
- 37 • considering the application of adaptive management principles on the tentatively
38 selected plan.

39
40 If the tentatively selected plan cannot be justified on a NAI basis, the PDT should consider
41 combining the tentatively selected plan with other CERP components to identify an
42 alternative that can be justified on a NAI basis or to consider delaying the implementation of
43 the tentatively selected plan in order for the tentatively selected plan to be justified on a NAI
44 basis.

**SECTION 3: GUIDANCE MEMORANDUM #3
SAVINGS CLAUSE REQUIREMENTS**

3.1 PURPOSE

This Guidance Memorandum provides guidance in determining whether or not the selected alternative plan and its operations meet the requirements of the Savings Clause of section 601(h)(5) of WRDA 2000. The Guidance Memorandum discusses procedures to determine if existing legal sources of water have been eliminated or transferred and whether levels of service for flood protection would be reduced.

3.2 APPLICABILITY

This Guidance Memorandum applies to all CERP projects. Identifying if an elimination or transfer of existing legal sources of water will occur as a result of implementation of CERP and whether levels of service for flood protection will be reduced by implementation of CERP is required by section 601(h)(5) of WRDA 2000. The PDT will conduct these analyses on the selected alternative plan. It is important for the PDT to note that the analyses described in this Guidance Memorandum pertain specifically to the analyses required for compliance with the Savings Clause of section 601(h)(5) of WRDA 2000. In addition to the analyses conducted under the Savings Clause, the PDT should conduct other appropriate analyses, such as those described in section 1.11 of Guidance Memorandum #1, to determine if the selected alternative plan will affect other rights provided under Federal or State law. It is also important for the PDT to recognize that a preliminary screening analysis of potential Savings Clause issues should be conducted as part of the formulation and evaluation process conducted for the PIR; however, alternative plans should be primarily evaluated and compared based on the benefits produced by each plan (see Guidance Memorandum #1 and Guidance Memorandum #2). If there are trade-offs in performance for natural areas that need to be considered, those trade-offs should be evaluated and justified as part of the formulation and evaluation process. The relationship between the Savings Clause analysis and other PIR tasks is shown in Figure 3-1.

Figure 3-1: Relationship between Savings Clause and Other PIR Tasks

1 The Savings Clause analyses of this Guidance Memorandum also apply to proposed changes
2 to Project Operating Manuals (POM) and the System Operating Manual (SOM) (see
3 Guidance Memorandum #5). As modifications to POMs and the SOM are evaluated,
4 identifying if an elimination or transfer of existing legal sources of water will occur as a
5 result of implementation of a CERP operational change and whether levels of service for
6 flood protection will be reduced by a CERP operational change will be necessary.

8 **3.3 SAVINGS CLAUSE**

9
10 For the components of CERP, the original purpose and intent was to improve quantity,
11 quality, timing, and distribution of water for the natural system and for other water-related
12 needs of the region. It is anticipated that if more water is made available for the natural
13 system in South Florida through implementation of the Plan, more water should also be
14 available for other existing and future uses. Under some circumstances, depending on the
15 project components, the hydrologic changes inherent in the design of those components, and
16 the sequence for implementation of CERP projects, existing legal sources of water may be
17 partially or entirely eliminated or transferred to new sources as a result of project
18 implementation. The PDT must determine whether a project will cause an elimination or
19 transfer of an existing legal source that was in existence on the date of enactment of WRDA
20 2000 (i.e. December 11, 2000). The specific requirement in section 601(h)(5) of WRDA
21 2000 is:

22 “Until a new source of water supply of comparable quantity and quality as that
23 available on the date of enactment of this Act is available to replace the water to be
24 lost as a result of implementation of the Plan, the Secretary and the non-Federal
25 sponsor shall not eliminate or transfer existing legal sources of water, including those
26 for:

- 27 (i) an agricultural or urban water supply;
- 28 (ii) allocation or entitlement to the Seminole Indian Tribe of Florida under
29 section 7 of the Seminole Indian Land Claims Settlement Act of 1987
30 (25 U.S.C. 1772e);
- 31 (iii) the Miccosukee Tribe of Indians of Florida;
- 32 (iv) water supply for Everglades National Park; or
- 33 (v) water supply for fish and wildlife.”

34
35 In addition to the provision regarding elimination or transfer of existing legal sources of
36 water, the Savings Clause requires that:

37 “Implementation of the Plan shall not reduce levels of service for flood protection
38 that are:

- 39 (i) in existence on the date of enactment of this Act; and
- 40 (ii) in accordance with applicable law.”

41
42 To help meet this statutory obligation, the Programmatic Regulations require that the
43 operational conditions included in the Pre-CERP Baseline be considered in the appropriate
44 analyses in each PIR.

1 Lastly, the Savings Clause of section 601(h)(5) of WRDA 2000 has specific protections
2 regarding the Seminole Tribe’s compact:

3 “Nothing in this section amends, alters, prevents, or otherwise abrogates rights of the
4 Seminole Indian Tribe of Florida under the compact among the Seminole Tribe of
5 Florida, the State, and the SFWMD, defining the scope and use of water rights of the
6 Seminole Tribe of Florida, as codified by section 7 of the Seminole Indian Land
7 Claims Settlement Act of 1987 (25 U.S.C. 1772e).”

8
9 Projects are allowed to eliminate or transfer an existing legal source; however a replacement
10 source that is of comparable quantity and quality needs to be identified and be available prior
11 to the elimination or transfer. Projects may not reduce levels of service for flood protection.
12 Evaluation criteria for existing legal sources of water and for flood protection should not be
13 used as performance measures to compare or rank alternative plans, to select a preferred
14 alternative, or to measure project benefits. However, the PDT should conduct preliminary
15 screening analyses on the final array of alternative plans to determine potential effects on
16 existing legal sources of water and levels of service for flood protection.
17

18 **3.4 DEFINITION OF EXISTING LEGAL SOURCE**

19
20 The term “existing legal source” is unique to section 601 of WRDA 2000 and is not defined
21 in State or Federal law. The Programmatic Regulations require that a definition be developed
22 in this Guidance Memorandum. Accordingly, the following definition for existing legal
23 source is adopted for CERP:

24 “Existing legal source means the quantity and quality of water available within a
25 water basin (including seepage, surface water, direct rainfall, and groundwater) used
26 for a water supply, which is legally protected by Federal or State law, including the
27 quantity and quality necessary for protection of the source of supply, consistent with
28 State and Federal law, as of December 11, 2000, for:

- 29 (i) An agricultural or urban water supply;
- 30 (ii) Allocation or entitlement to the Seminole Indian Tribe of Florida under
31 section 7 of the Seminole Indian Land Claims Settlement Act of 1987
32 (25 U.S.C. 1772e);
- 33 (iii) the Miccosukee Tribe of Florida;
- 34 (iv) water supply for Everglades National Park; or
- 35 (v) water supply for fish and wildlife.”

36
37 This Guidance Memorandum provides analytical procedures for evaluating existing legal
38 sources of water as defined above.
39

40 **3.5 RELATIONSHIP OF SAVINGS CLAUSE TO OTHER** 41 **REQUIRED ANALYSES**

42
43 The Savings Clause has a very specific purpose: to protect existing legal sources of water
44 from elimination or transfer until a new source of comparable quantity and quality is
45 available and to protect levels of service for flood protection, existing and in accordance with
46 applicable law, from reduction by CERP projects. It is important for the PDT to understand

1 that just because implementation of the selected alternative plan would not cause a Savings
2 Clause impact, there are other analyses that the team needs to conduct to evaluate whether
3 there are impacts to the natural system or to other water users (See Attachments 3-A, 3-B,
4 and 3-C). Other analyses required by State law are discussed in section 1.11 of Guidance
5 Memorandum #1.

6 7 **3.6 LEGAL ENTITLEMENTS**

8
9 There are two entitlements existing in law outside of the Savings Clause that must be
10 considered in the Savings Clause analysis. The following sections describe these entitlements
11 and how they should be considered.

12 13 **3.6.1 Seminole Tribe of Florida**

14
15 The Seminole Tribe of Florida has a distinct set of water rights governed by Federal and
16 State law and various Agreements. In 1987, the United States Congress passed the Seminole
17 Indian Land Claims Settlement Act, P.L. 100-228, which incorporates the Water Rights
18 Compact among the Seminole Tribe of Florida, the State of Florida and the SFWMD. The
19 Florida Legislation enacted Chapter 87-292 and codified section 285.165, F.S., as the
20 companion State legislation regarding the Water Rights Compact. The intent of the Compact,
21 the Act, and the legislation was to create specifically defined water rights for the Tribe.

22
23 Section VI.A. of the Compact addresses agreements with landowners who may be affected
24 by operations of the Tribe under a tribal Work Plan. This Work Plan must be submitted to the
25 SFWMD for approval by the SFWMD Governing Board and amendment and is typically
26 approved on an annual basis. Under section VI.A., the SFWMD Governing Board may
27 approve private agreements between landowners and the Tribe, and if they are approved in
28 that manner, the agreements will have the force and effect of the Compact as between the
29 parties to the agreement. Section VI.B. addresses specific surface water entitlements for the
30 Brighton Reservation, the Hollywood Reservation, and the Big Cypress Reservation.

31
32 The Compact describes an Evaluation Criteria Manual to further define and explain the
33 conditions, criteria, and objectives of the Compact. The Compact also describes a Tribal
34 Water Code to ensure compliance with the Compact.

35
36 In 1989, an Agreement was approved between the SFWMD and the Tribe on an “Emergency
37 Plan for Implementation of Technical Report on Water Availability Estimates for the
38 Brighton Seminole Reservation–Water Shortage Conditions.” The Agreement stated that
39 when Lake Istokpoga can no longer release water, but while canals are still at or near
40 optimum levels, the District will deliver the Tribe fifteen percent (15%) of the available
41 water in the canals.

42
43 In 1992, under section VI.A. of the Compact, an Agreement was signed between the
44 SFWMD and the Seminole Tribe of Florida entitled “Providing for Water Quality, Water
45 Supply and Flood Control Plans for the Big Cypress Seminole Indian Reservation and the
46 Brighton Seminole Indian Reservation Implementing Section V.C. and VI.D. of the Water

1 Rights Compact.” This Agreement has the full force and effect of the 1987 Water Rights
2 Compact. This 1992 Agreement provided for cooperation between the SFWMD and the
3 Tribe to ensure that water quality criteria are addressed in the C-139 Basin and in waters
4 entering the Big Cypress Seminole Indian Reservation. This 1992 Agreement also addresses
5 the Tribe’s Compact rights to surface waters for the Brighton Reservation.

6
7 The Compact, Evaluation Criteria Manual, Tribal Water Code, various Agreements and
8 applicable Federal and State laws constitute the sources of regulation of consumptive water
9 use, the management and storage of surface water and groundwater on Reservation and
10 Tribal Trust lands.

11
12 The PDT will evaluate potential effects on water allocations to the Seminole Brighton
13 Reservation. The PDT should use the estimated Tribal Work Plan Allocation for the Brighton
14 Reservation of 2,561.74 million gallons per maximum month (MGMM) which is composed
15 of 360 MGMM groundwater, 546.1 MGMM Lakeshore Perimeter surface water, and
16 1655.64 MGMM Indian Prairie Basin Surface Water to determine the Tribe’s existing legal
17 source for the Brighton Reservation. Allocations for the Tribe’s other reservations are
18 captured in the Pre-CERP Baseline.

19 20 **3.6.2 Minimum Deliveries for Everglades National Park**

21
22 In 1970, Congress passed the Minimum Deliveries Act, Public Law 91-282. The Act
23 mandated that deliveries to Everglades National Park (ENP) will not be less than 315,000
24 acre-feet annually or 16.5 per cent of the total deliveries from the C&SF Project System for
25 all purposes, including ENP, whichever is less. The accompanying Senate Report divided
26 this quantity of water between Shark Slough, Taylor Slough, and the Eastern Panhandle of
27 the Park, and provided monthly schedules for each of the delivery points.

28
29 In 1983, the Experimental Water Deliveries Program was authorized to develop a better
30 hydrologic regime (PL 98-181). The 1983 Act authorized the USACE, with the concurrence
31 of the National Park Service and the SFWMD, to modify the schedule for delivery of water
32 to ENP as required by the Minimum Deliveries Act for two years to conduct an experimental
33 program of water deliveries from the C&SF Project to ENP. Then in 1991, PL 102-104
34 amended PL 98-181 to allow the Experimental Program to continue until the modifications to
35 the C&SF Project authorized in the Everglades National Park Protection and Expansion Act
36 of 1989 are completed and implemented.

37
38 It is important to note, however, that while the experimental program modified the minimum
39 deliveries schedule, it had not been superseded or repealed by a subsequent Federal law on
40 the date of enactment of WRDA 2000. It is the intent of the Modified Water Deliveries to
41 Everglades National Park Project and CERP to change the distribution of water set forth in
42 the Minimum Deliveries Act and provide a more natural hydrologic regime to Everglades
43 National Park. Since it has been recognized that the distribution of water in the Minimum
44 Deliveries Act does not constitute a natural hydrologic regime, the Minimum Deliveries Act
45 will not be utilized for purposes of the Savings Clause. Although it is not a plan formulation
46 objective, it is desirable to compare the C&SF Project delivery quantities to Everglades

1 National Park with the quantities of water in the Minimum Deliveries Act. The PDT will
2 follow the procedure set forth in Attachment 3-D to provide an accounting of the amount of
3 water delivered to Everglades National Park.

4 5 **3.7 THE PRE-CERP BASELINE**

6
7 The Pre-CERP Baseline is a description of assumed hydrologic conditions on the date of
8 enactment of WRDA 2000 (i.e. December 11, 2000), including a simulation of these
9 conditions, which has been developed to satisfy the requirements of the Programmatic
10 Regulations as a tool in the implementation of the Savings Clause (section 601(h)(5) of
11 WRDA 2000). The Programmatic Regulations define the Pre-CERP Baseline as:

12 “...the hydrologic conditions in the South Florida ecosystem on the date of enactment
13 of WRDA 2000, as modeled by using a multi-year period of record based on
14 assumptions such as land use, population, water demand, water quality, and assumed
15 operations of the C&SF Project.”

16
17 The Pre-CERP Baseline document (U.S. Army Corps of Engineers and South Florida Water
18 Management District, 2005) provides a description of the model assumptions necessary to
19 simulate the pre-CERP hydrologic conditions. Although regional models and model versions
20 may change over time, the assumptions that define the Pre-CERP Baseline will not be
21 changed.

22 23 **3.7.1 Miccosukee Tribe of Indians of Florida**

24
25 The Miccosukee Tribe of Indians of Florida has lived in the Everglades for generations and
26 their culture and way of life is dependent on a healthy Everglades. The Miccosukee Tribe is
27 generally recognized to be successor to any existing rights of the Seminole Indians under the
28 Everglades National Park Enabling Act, 16 U.S.C. 410 (b), which are not in conflict with the
29 purposes for which the Everglades National Park (ENP) is created. On October 30, 1998,
30 Congress clarified the rights of the Miccosukee Tribe, which became Federally recognized in
31 1962, to live and govern its own affairs in perpetuity in manners consistent with the
32 Miccosukee Reserved Act Area (MRAA) for purposes of the administration, education,
33 housing, and cultural activities of the Tribe within a 666.6 acre Miccosukee Reserved Area
34 (MRA) within the boundary of ENP (See MRAA, 16 U.S.C. 410). The MRA also contains
35 provisions to protect the ENP outside the boundaries of the MRA from adverse effects of
36 structures or activities within that area, and to support restoration of the South Florida
37 ecosystem, including restoration of the environment of the ENP. The Tribe’s interests also
38 include a 75,000-acre Federal Indian Reservation that is held in trust by the Federal
39 government. The Tribe has established water quality standards under the Clean Water Act for
40 the Federal Reservation. The Tribe also has a perpetual lease from the State of Florida to a
41 Leased Area in WCA 3 in accordance with The Florida Indian Claims Settlement Act. The
42 Leased Area has for many years comprised part of WCA 3 as part of the Federally authorized
43 project of flood control and water management for Central and Southern Florida. As stated in
44 the Lease Agreement appended as Exhibit A to the Settlement Agreement in Miccosukee
45 Tribe of Indians of Florida v. State of Florida, Case No. 79-253-Civ-JWK, in the United
46 States District Court for the Southern District of Florida, Miami Division, the Tribe is subject

1 to and shall not interfere with rights, duties and obligations of the SFWMD or the USACE,
2 pursuant to the requirements of the Central and Southern Florida Project, the requirements of
3 the Federally authorized project conveyances, easements, grants, rules, statutes, or any other
4 present or future lawful authority to manage, regulate, raise or lower the water levels within
5 the Leased Area in WCA 3. Additionally, the Tribe is permitted under Public Law 93-440 to
6 continue their usual and customary use and occupancy of Federal or Federally acquired lands
7 and waters within the Big Cypress Preserve and the Addition Lands, including hunting and
8 fishing on a subsistence basis, gathering of native plants, and conducting tribal ceremonies.
9 In addition, there are Indian communities consisting of several Indian camps along Tamiami
10 Trail.

11 **3.7.2 Agricultural and Urban Water Supply**

12 The existing legal sources of water for agricultural and urban water supplies in the Pre-CERP
13 Baseline were determined using model assumptions based on the actual levels of
14 consumptive use in existence as of the date of enactment of WRDA 2000. This methodology
15 is consistent with the basic underlying principle used to choose assumptions for other
16 existing legal sources of water, which is to represent as closely as possible the actual
17 conditions in place in the system as of the date of enactment of WRDA 2000 (December 11,
18 2000). Permitted allocations in existence as of the date of enactment of WRDA 2000 which
19 were not utilized would have incorporated projected demands over the life of the permit that
20 may not have been in existence at that date.
21
22

23 Non-irrigation urban demands were calculated based on the actual pumpage and distribution
24 in the year 2000. Urban irrigation and agricultural demands, including diversion and
25 impoundment uses to supply these demands, were calculated based on the land use and crop
26 acreage that existed as of 2000.
27
28

29 In addition, there are water deliveries made to the Lower East Coast in order to prevent salt
30 water intrusion into water supply sources for urban and agricultural uses. Operations of the
31 C&SF Project for these purposes are identified in the “USACE Water Control Plan for the
32 Lower East Coast Canals” and are incorporated into assumptions in the Pre-CERP Baseline.
33

34 **3.7.3 Water Supply for Everglades National Park and for Fish and Wildlife**

35 Water supply for ENP is primarily provided through regulated environmental releases
36 through the S-12 structures and other operations of the C&SF Project. In December 2000, the
37 C&SF Project in south Miami-Dade County operated according to the Interim Structural and
38 Operational Plan (ISOP) in an attempt to meet the Reasonable and Prudent Alternative to
39 avoid jeopardizing the Cape Sable Seaside Sparrow. This version of ISOP failed to meet the
40 Reasonable and Prudent Alternative and was later replaced by the Interim Operating Plan
41 (IOP), which is anticipated to remain in place until the Combined Structural and Operating
42 Plan (CSOP) is implemented. For purposes of the Pre-CERP Baseline, the model
43 assumptions for ISOP model run 9dr (also known as ISOP 2001), the operational regime
44 actually in place on the date of enactment of WRDA 2000, are used in the Pre-CERP
45 Baseline.
46

1
2 Due to the highly managed nature of South Florida’s hydrology, much of the water on which
3 fish and wildlife depend is affected, directly, or indirectly, by deliveries made through the
4 C&SF Project system for regulatory releases and other activities not explicitly intended to
5 benefit fish and wildlife. Fish and wildlife habitat occurs in uplands, wetlands, and estuaries
6 throughout the region in vegetation communities that depend on appropriate sources of
7 groundwater, surface water, and flows to tide.

8 9 **3.8 INTERVENING NON-CERP ACTIVITIES**

10
11 The Savings Clause only applies to changes from the date of enactment of WRDA 2000 that
12 result from “implementation of the Plan.” In some cases, the existing legal sources of water
13 and the level of service for flood protection that existed at that time may be altered or
14 changed before a CERP project is implemented. These changes may result from actions by
15 Federal, Tribal, State, and local governments—actions that are wholly outside the CERP
16 process. These “intervening” conditions, brought about by the implementation of non-CERP
17 activities after the date of enactment of WRDA 2000, but before a CERP project component
18 becomes operational, may change the hydrologic conditions from those reflected in the Pre-
19 CERP Baseline. Examples include construction of government public works projects that
20 impact the configuration of the C&SF Project system (e.g., Modified Water Deliveries to
21 ENP, C-111, and C-51 projects); construction of projects that impact the use of water from
22 the C&SF Project system (e.g., stormwater treatment areas); changes to operations of the
23 C&SF Project system (e.g., IOP, CSOP, Lake Okeechobee Regulation Schedule) and the
24 issuance of consumptive use permits under State law. When the Pre-CERP Baseline
25 conditions have already been altered by this kind of intervening non-CERP activity, a
26 different analysis is required for the purpose of applying the Savings Clause.

27
28 This Guidance Memorandum provides guidance to PDTs in their analyses when dealing with
29 intervening non-CERP activities. In general, the following principles will apply:

- 30 • The Savings Clause does not require CERP to make up for reductions in quantity and
31 quality of existing legal sources of water or levels of service for flood protection
32 caused by intervening non-CERP activities, but it does prohibit CERP projects from
33 further reductions.
- 34 • The Savings Clause does not prohibit CERP from reducing quantity and quality of
35 existing legal sources of water or levels of service for flood protection that were
36 increased by intervening non-CERP activities, but it does prohibit CERP projects
37 from reducing those increases below those in place on the date of enactment of
38 WRDA 2000.

39
40 As an example, there have already been intervening non-CERP activities that have altered the
41 hydrology affecting ENP. There have been operational changes since the ISOP, which is the
42 operating schedule used in the Pre-CERP Baseline modeling. These operational changes,
43 including the IOP, have had as their primary purpose avoiding jeopardy to the Cape Sable
44 Seaside Sparrow until completion of construction of the Modified Water Deliveries Project
45 and the 1994 C-111 General Reevaluation Report (GRR) modifications and the
46 implementation of the CSOP, at which point in time these projects will become intervening

1 non-CERP activities. The IOP is considered an intervening non-CERP activity. The future
2 construction of the Modified Water Deliveries to ENP Project and the 1994 C-111 GRR
3 features, together with the implementation of CSOP, will also be intervening non-CERP
4 activities.

5
6 Additional examples and further guidance are provided in Attachments 3-E and 3-F. It is
7 important for the PDT to note that although the Savings Clause does not prohibit CERP
8 projects from reducing benefits increased by intervening non-CERP activities, other analyses,
9 such as those required by Florida law, may prohibit the project from reducing benefits
10 increased by intervening non-CERP activities as discussed elsewhere; also see Attachments
11 3-A, 3-B, and 3-C. Notwithstanding the Savings Clause analysis described above, projects
12 will be formulated to achieve the optimum benefits consistent with the goals and purposes of
13 each CERP project.

14 15 **3.9 MODEL SELECTION FOR SAVINGS CLAUSE ANALYSES**

16
17 In general, the PDT should use the same models that are used for plan formulation. However,
18 should the PDT determine that additional models are necessary, the PDT must present its
19 recommendations for management approval. Modeling for the Saving Clause analyses of
20 both existing legal sources of water and levels of service for flood protection should use the
21 same assumptions and project operations.

- 22 • Evaluations should be done across a full range of hydrologic conditions, including
23 wet, average, and dry years.
- 24 • The method used to quantify existing legal sources of water should be sensitive to
25 conditions during which users of a source are most likely to be affected by changes in
26 water quantity or quality.

27
28 The major regions of the South Florida ecosystem have been separated into water basins to
29 determine existing legal sources of water. These water basins are shown as Figure 3-G-1 and
30 listed in Table 3-G-1 in Attachment 3-G. These designated basins should be used for most
31 existing legal source determinations. However, there may be project specific circumstances
32 which indicate that a smaller scale approach for determination of existing legal sources is
33 needed. Any proposed exception to the designated basins must be elevated through the DCT
34 to the QRB for discussion.

35
36 The model chosen for the evaluation should incorporate the full range of available
37 meteorological conditions since the determination of elimination or transfer and levels of
38 service for flood protection are based on the performance of the system as modeled against a
39 range of weather conditions. However, it is recognized that the PDT may determine that
40 modeling the full period of record is impractical and that, in their professional judgment,
41 modeling a subset of the full period of record is an adequate substitute. If a subset of years is
42 chosen, the PDT should use a consistent subset for all Savings Clause analyses and the subset
43 should be a representative sample of the range of conditions in the historical period of record
44 including intra- and inter-annual variations. The PDT should document the selection of
45 period of record used in the model.

1 As many CERP components are regional in scale, the Pre-CERP Baseline currently uses the
2 SFWMM as the regional modeling tool for the area within the geographical limit of the
3 model. Since regional models typically consist of large grid cells, only a general indication of
4 flood protection can be determined through regional analysis. For that reason, smaller-scale
5 integrated ground and surface water models may also be necessary for specific analysis of
6 levels of service for flood protection.

7 8 **3.10 IDENTIFYING IF THERE IS AN ELIMINATION OR TRANSFER** 9 **OF EXISTING LEGAL SOURCES OF WATER**

10 11 **3.10.1 Identifying Existing Legal Sources of Water to be Evaluated**

12
13 The PDT should identify all existing legal sources of water that could be affected by the
14 project. The procedures in Attachment 1-A of Guidance Memorandum #1 should be used to
15 determine the spatial extent of project effects. Once this geographical boundary is identified,
16 the PDT should identify all existing legal sources of water within the boundary. Several
17 sources of information are available to assist the PDT:

- 18 • Defined project purposes
- 19 • Information developed in the last completed PIR
- 20 • Maps of existing legal source basins within the regions affected by the project
- 21 • The Existing Conditions Baseline and the Pre-CERP Baseline

22
23 Some projects are intended to transfer users to different sources and clearly will require
24 evaluation. Other cases of elimination or transfer of a source may be an incidental or
25 unanticipated effect of a project. The analysis will need to address both types of elimination
26 or transfer of sources.

27 28 **3.10.2 Consider Project-level and System-wide Effects on All Existing Legal** 29 **Sources of Water**

30
31 Generally, the evaluation of existing legal sources of water should be conducted at a system-
32 wide level for projects that show system-wide effects, using available regional and sub-
33 regional hydrologic and water quality models and other information. Some projects are
34 hydrologically separate from the regional water management system. Projects that do not
35 affect regional water deliveries are exempt from the system-wide evaluations described in
36 this Guidance Memorandum; however, the PDT should use an approach consistent with the
37 procedures in this Guidance Memorandum. For both types of evaluations, the geographical
38 evaluation area should be large enough to consider all potential effects on existing legal
39 sources of water. Existing legal sources of water that are not affected should be identified and
40 documented. Attachment 1-A of Guidance Memorandum #1 provides a procedure for
41 determining whether a project has system-wide or project-level effects and for determining
42 the spatial extent of project effects.

1 **3.10.3 Identifying an Elimination or Transfer of Water**

2
3 **3.10.3.1 Analysis for PIRs**

4
5 The PDT should follow the steps described in this section and depicted in Attachment 3-H to
6 identify if the project creates an elimination or transfer of water. Additional guidance as to
7 the effect of intervening non-CERP activities on determining if implementation of the
8 selected alternative plan would result in an elimination or transfer is provided in Attachment
9 3-E.

10
11 **Step 1**

12 In Step 1, the inflow volume-probability curve for the Initial Operating Regime (IOR) will be
13 compared to the inflow volume-probability curve for the Existing Conditions Baseline for
14 each of the water basins in Attachment 3-G. Figure 3-2 shows an example of a volume-
15 probability curve. The IOR and Existing Conditions Baseline inflow volume-probability
16 curves should be displayed on the same graphic.

17
18 The results of the Step 1 analysis should reveal if the Initial Operating Regime reduces the
19 overall quantity of water to one or more of the basins. If the comparison of the Initial
20 Operating Regime with the Existing Conditions Baseline shows no significant reduction, then
21 implementation of the selected alternative plan will not cause an elimination or transfer of
22 existing legal sources of water, and the requirements of the Savings Clause have been met.
23

24
25 **Figure 3-2: Example of a Volume-Probability Curve**
26

1
2 If the IOR shows a significant reduction in volume from the Existing Conditions Baseline for
3 one or more basins, then further analysis is needed. If the analysis shows that the reduction is
4 necessary to achieve natural system performance, then implementation of the selected
5 alternative plan will not cause an elimination or transfer of existing legal sources of water,
6 and the requirements of the Savings Clause have been met. If the reduction is not necessary
7 to achieve natural system performance, then the PDT must proceed to Step 2.

8 9 **Step 2**

10 In Step 2, the inflow volume-probability curve for the Initial Operating Regime will be
11 compared to the inflow volume-probability curve for the Pre-CERP Baseline for each of the
12 water basins in Attachment 3-G. The IOR and Pre-CERP Baseline inflow volume-probability
13 curves should be displayed on the same graphic.

14
15 The results of the Step 2 analysis should reveal if the Initial Operating Regime reduces the
16 overall quantity of water to one or more of the basins. If the comparison of the Initial
17 Operating Regime with the Pre-CERP Baseline shows no significant reduction, then
18 implementation of the selected alternative plan will not cause an elimination or transfer of
19 existing legal sources of water, and the requirements of the Savings Clause have been met.

20
21 If the IOR shows a significant reduction in volume from the Pre-CERP Baseline in one or
22 more basins, then further analysis may be needed. If the analysis shows that the reduction in
23 a basin is necessary to achieve natural system performance, then implementation of the
24 selected alternative plan will not cause an elimination or transfer of existing legal sources of
25 water, and the requirements of the Savings Clause have been met. If the reduction is not
26 necessary to achieve natural system performance, then the PDT must proceed to Step 3.

27 28 **Step 3**

29 In Step 3, the PDT will need to determine if the reduction in volume is due to changes in
30 demands or other assumptions rather than implementation of the CERP project. This will be
31 accomplished by modeling the IOR without the selected alternative plan. The inflow volume-
32 probability curves for the IOR without the selected alternative plan will be compared to the
33 IOR for each of the water basins in Attachment 3-G. The IOR without the selected alternative
34 plan and the IOR should be displayed on the same graphic. If the IOR does not show any
35 significant reduction in volume from the IOR without the selected alternative plan, then the
36 Savings Clause requirements have been met because the reduction in volume found in the
37 previous two steps is due to changes in demands, operations, or other assumptions rather than
38 implementation of the CERP project. If the IOR shows a significant reduction in volume
39 from the IOR without the selected alternative plan, then the PDT will need to develop a
40 replacement source (see sections 3.10.6 and 3.10.7).

41 42 **3.10.3.2 Analysis for Revisions to Operating Manuals**

43
44 The Savings Clause analyses of this Guidance Memorandum also apply to revisions to
45 Project Operating Manuals (POM) and the System Operating Manual (SOM). As
46 modifications to POMs and the SOM are evaluated, identifying if an elimination or transfer

1 of existing legal sources of water will occur as a result of implementation of a CERP
2 operational change will be necessary. The PDT should follow the same steps described in the
3 above section for PIRs, except that the IOR should be updated for current conditions at the
4 time that the analysis is conducted to identify if the project creates an elimination or transfer
5 of water.
6

7 **3.10.4 How Much of a Difference Between the Conditions Does it Take to** 8 **Have an Elimination or Transfer?** 9

10 It requires more than a simple volume change or change in water quality to have an
11 elimination or transfer of existing legal sources of water under the Savings Clause. Changes
12 between the Initial Operating Regime and the Existing Conditions Baseline should be
13 significant. In the case of intervening non-CERP activities, differences between the Initial
14 Operating Regime and the Pre-CERP Baseline should be significant. The determination of
15 whether a volume change or a change in water quality is significant must be done on a case-
16 by-case basis. The reason that there are no required criteria for evaluation is that this
17 evaluation is fact specific—what is significant in one case may not be significant in another
18 case. In consultation with affected entities, the PDT should consider and document all
19 technical, factual, and other relevant information used in this determination.
20

21 **3.10.5 How to Determine if a Replacement Source is a Comparable Source?** 22

23 Implementation of a CERP project cannot result in the elimination or transfer of an existing
24 legal source of water unless that source will be replaced with a source of comparable quantity
25 and quality as that available on the date of enactment of WRDA 2000.
26

27 If the PDT determines that an elimination or transfer will occur, the team must then ensure
28 that the replacement source is a comparable source in terms of water quality and quantity.
29 The PDT will make this determination utilizing specific technical information available to
30 the team. The following determinations must be included in the evaluation of whether a
31 replacement source is a comparable source:
32

- 33 1. Determine whether the replacement source is sufficient to meet the demands from the
34 existing legal source.
35
- 36 2. Determine whether the replacement source is sufficiently similar to that of the
37 existing legal source in terms of its legal feasibility. In order to make this
38 determination, the PDT, along with appropriate legal staff from USACE and the non-
39 Federal sponsor, will need to identify that the necessary legal authorization to
40 implement and use the sources of supply for the intended purpose can be obtained.
41
- 42 3. Determine whether the replacement source is sufficiently similar to that of the
43 existing legal source in terms of its technical and economic feasibility. To make this
44 determination, the quality of the replacement source shall be compared to the quality
45 of the existing legal source. If these are comparable, no further analysis is necessary.

1 If the replacement source is not comparable and no other sources of comparable
2 quality are available, see section 3.10.7.
3

4 **3.10.6 What to Do if a Comparable Source Cannot Be Identified**

5
6 The following are examples of actions that the PDT may evaluate if analyses show that
7 implementation of the selected alternative plan would result in an elimination or transfer of
8 an existing legal source and a comparable replacement source cannot be identified:

- 9 • Modify the operations of the selected alternative plan to avoid an elimination or
10 transfer (Note: this requires additional formulation. See Guidance Memorandum #2).
- 11 • Redesign the selected alternative plan to avoid an elimination or transfer (Note: this
12 requires additional formulation. See Guidance Memorandum #2).
- 13 • Determine if there are other CERP projects scheduled concurrently with the subject
14 project that will solve the elimination or transfer issue. If so, the elimination or
15 transfer by the subject project is no longer an issue.
- 16 • Consider rescheduling the project concurrently with other components to avoid an
17 elimination or transfer or to ensure that a comparable replacement source is available.
- 18 • Formulate additional alternative plans or modifications to the selected alternative
19 plan. (Note: this requires additional formulation. See Guidance Memorandum #2).
- 20

21 If the above actions are not feasible and the elimination or transfer can not be remedied, the
22 PDT may recommend that the project be discontinued. A recommendation to discontinue a
23 project will be reviewed by the appropriate decision-makers for the USACE and the non-
24 Federal sponsor. Consultation in accordance with the provisions of the Programmatic
25 Regulations will occur before a decision to discontinue a project is finalized.
26

27 **3.11 DETERMINING IF LEVELS OF SERVICE FOR FLOOD** 28 **PROTECTION HAVE BEEN REDUCED**

29 30 **3.11.1 Levels of Service for Flood Protection to be Evaluated**

31
32 The Programmatic Regulations define levels of service for flood protection as “the expected
33 performance of the Central and Southern Project and other water management systems in the
34 South Florida ecosystem, consistent with applicable law, for a specific area or region.”
35 Section 601(h)(5) of WRDA 2000 did not limit levels of service for flood protection only to
36 Federal law, but includes Federal and State law. State law includes levels of service for flood
37 protection provided by subdivisions of the State, including water management districts,
38 special taxing districts, and local governments. As such, in order to meet the second
39 requirement, operational conditions associated with approved Federal, Tribal, State, and local
40 public works projects were included as assumptions in the Pre-CERP Baseline model run.
41 These operational conditions incorporate regulation schedules for the natural system and the
42 secondary and tertiary canal systems in south Florida to ensure that levels of service for flood
43 protection are maintained in urban and agricultural areas. Generally, it should not be
44 necessary to conduct Savings Clause analyses below this level. Depending upon site-specific
45 conditions, it may be necessary to do more detailed analyses. The level of evaluation
46 performed must be consistent for urban and agricultural areas.

1
2 The PDT should identify all urban and agricultural areas within the study area where levels
3 of service for flood protection could be affected by a project. The procedures in Attachment
4 1-A of Guidance Memorandum #1 should be used to determine the spatial extent of project
5 effects. Several sources of information are available to assist the PDT:

- 6 • Defined project purposes
- 7 • Information developed in the last completed PIR
- 8 • The Existing Conditions Baseline and the Pre-CERP Baseline

9
10 The PDT must evaluate if levels of service for flood protection have been reduced on a
11 project-by-project basis.

12 13 **3.11.2 Levels of Service for Flood Protection are Based on Performance** 14 **Modeled Against a Range of Conditions, Not a Design Level**

15
16 The purpose of the Savings Clause is not to allow implementation of CERP projects that
17 would reduce levels of service for flood protection existing as of December 2000. In the
18 definition of “levels of service for flood protection” in the Programmatic Regulations, the
19 term “expected performance” refers to the performance of the system actually in place when
20 modeled against the period of record. It does not refer to specific design flood targets such as
21 the 10-year or 100-year flood event.

22
23 Standard project flood and project design flood are not the same as Savings Clause “levels of
24 service of flood protection...in existence on date of enactment.” Standard project flood and
25 similar terms are shorthand statements of design goals. They do not reflect the levels of
26 service in existence in December 2000. There are several reasons for this:

- 27 • The project may not have been authorized as designed.
- 28 • Congress may not have funded the complete project as it was designed.
- 29 • Separate reaches of a project may have different levels of protection because of
30 variance in the scope of project response to the flood threat.
- 31 • The level of protection may change over time because of new land uses or upstream
32 development or because of other changed conditions, such as additional projects.
- 33 • Other projects may have been built which affected the original design level of flood
34 protection; subsequent projects may have modified or superseded the original design
35 plan.
- 36 • Operations of connected projects may have been changed and affected the feasibility
37 of the originally projected level.
- 38 • Other circumstances may have affected the design level originally projected.

39
40 Finally, the Pre-CERP Baseline is defined by the Programmatic Regulations to mean the
41 hydrological response of the system and operations in existence in December 2000 based
42 upon the climatic conditions for a specific period of record rather than to a design flood level.

43 44 **3.11.3 Analyze the Selected Alternative Plan for Reductions in Levels of** 45 **Service for Flood Protection**

1 **3.11.3.1 Analysis for PIRs**
2

3 The PDT should follow the steps described in this section to identify if the project reduces
4 levels of service for flood protection. Additional guidance as to the effect of intervening non-
5 CERP activities on determining if implementation of the selected alternative plan would
6 reduce levels of service for flood protection is provided in Attachment 3-F. Attachment 3-C
7 provides a list of other analyses of flood protection to be performed in addition to that
8 required by the Savings Clause. Attachment 3-I provides a checklist for the levels of service
9 for flood protection analysis for the selected alternative plan.
10

11 **Step 1**

12 In Step 1, the stage-duration curve for the Initial Operating Regime (IOR) will be compared
13 to the stage-duration curve for the Existing Conditions Baseline for each of the water basins
14 in Attachment 3-G. The stage-duration curves for the IOR and Existing Conditions Baseline
15 should be displayed on the same graphic.
16

17 The results of the Step 1 analysis should reveal if the Initial Operating Regime reduces the
18 levels of service for flood protection to one or more of the basins. If the comparison of the
19 Initial Operating Regime with the Existing Conditions Baseline shows no significant and
20 adverse reduction, then implementation of the selected alternative plan will not cause a
21 reduction in levels of service for flood protection, and the requirements of the Savings Clause
22 have been met.
23

24 If the IOR shows a significant and adverse reduction in levels of service for flood protection
25 from the Existing Conditions Baseline in one or more basins, then the PDT must proceed to
26 Step 2.
27

28 **Step 2**

29 In Step 2, the stage-duration curve for the Initial Operating Regime will be compared to the
30 stage-duration curve for the Pre-CERP Baseline for each of the water basins in Attachment 3-
31 G. The stage-duration curves for IOR and Existing Conditions Baseline should be displayed
32 on the same graphic.
33

34 The results of the Step 2 analysis should reveal if the Initial Operating Regime reduces the
35 levels of service for flood protection to one or more of the basins. If the comparison of the
36 Initial Operating Regime with the Existing Conditions Baseline shows no significant and
37 adverse reduction, then implementation of the selected alternative plan will not cause a
38 reduction in levels of service for flood protection, and the requirements of the Savings Clause
39 have been met.
40

41 If the IOR shows a significant and adverse reduction in levels of service for flood protection
42 from the Pre-CERP Baseline in one or more basins, then the PDT must proceed to Step 3.
43

44 **Step 3**

45 In Step 3, the PDT will need to determine if the reduction in levels of service for flood
46 protection is due to changes in demands or other assumptions rather than implementation of

1 the CERP project. This will be accomplished by modeling the IOR without the selected
2 alternative plan. The IOR without the selected alternative plan will be compared to the IOR
3 for each of the water basins in Attachment 3-G. The IOR without the selected alternative plan
4 and the IOR should be displayed on the same graphic. If the IOR does not show any
5 significant reduction in levels of service for flood protection from the IOR without the
6 selected alternative plan, then the Savings Clause requirements have been met because the
7 reduction in levels of service found in the previous two steps is due to changes in demands,
8 operations, or other assumptions rather than implementation of the CERP project. If the IOR
9 shows a significant reduction in levels of service for flood protection from the IOR without
10 the selected alternative plan, then the PDT will need to consider actions to solve the
11 reduction (see section 3.11.5).

12 13 **3.11.3.2 Analysis for Revisions to Operating Manuals**

14
15 The Savings Clause analyses of this Guidance Memorandum also apply to revisions to
16 Project Operating Manuals (POM) and the System Operating Manual (SOM). As
17 modifications to POMs and the SOM are evaluated, identifying whether levels of service for
18 flood protection will be reduced by a CERP operational change will be necessary. The PDT
19 should follow the same steps described in the above section for PIRs, except that the IOR
20 should be updated for current conditions at the time that the analysis is conducted to identify
21 if the project reduces levels of service for flood protection.

22 23 **3.11.4 How Much of a Difference Between the Conditions Does it Take to** 24 **Have a Reduction in Levels of Service for Flood Protection?**

25
26 It requires more than a simple change in hydrological response to “reduce levels of service
27 for flood protection” under the Savings Clause. Differences between the Initial Operating
28 Regime and the Existing Conditions Baseline should be significant and adverse. In the case
29 of intervening non-CERP activities, differences between the Initial Operating Regime and the
30 Pre-CERP Baseline should be significant and adverse. The PDT should consider all technical
31 information, including approved performance measures in determining if the reduction in
32 levels of service for flood protection is significant and adverse, and thus prohibited. The
33 intent of the Savings Clause is to avoid harm to existing levels of service for flood protection,
34 and not to avoid harmless differences in project operations.

35 36 **3.11.5 What to do if a Selected Alternative Plan Reduces the Levels of** 37 **Service for Flood Protection**

38
39 The following are examples of actions that the PDT may evaluate if analyses show that
40 implementation of the selected alternative plan would result in a reduction in levels of service
41 for flood protection:

- 42 • Modify the operations of the selected alternative plan to avoid a reduction in levels of
43 service for flood protection (Note: this requires additional formulation. See Guidance
44 Memorandum #2).

- 1 • Redesign the selected alternative plan to avoid a reduction in levels of service for
2 flood protection (Note: this requires additional formulation. See Guidance
3 Memorandum #2).
- 4 • To the extent consistent with Federal and State law, consider acquisition (fee or
5 easement) of affected property if redesign of the selected alternative plan would not
6 be cost-effective. Cost-effectiveness is required by the Programmatic Regulations,
7 and the PDT should carefully evaluate whether acquisition of a flowage or
8 conservation easement is more cost-effective than fee acquisition. (Note: this requires
9 additional formulation. See Guidance Memorandum #2).
- 10 • If a redesign or property acquisition is not justified and cost-effective for the project
11 alone, consider whether combining the project with other components would be
12 justified and cost-effective.
- 13 • Formulate additional alternative plans or modifications to the selected alternative
14 plan. (Note: this requires additional formulation. See Guidance Memorandum #2).

15
16 If the above actions are not feasible and the reduction of levels of service for flood protection
17 can not be remedied, the PDT may recommend that the project be discontinued. A
18 recommendation to discontinue a project will be reviewed by the appropriate decision-
19 makers for the USACE and the non-Federal sponsor. Consultation in accordance with the
20 provisions of the Programmatic Regulations will occur before a decision to discontinue a
21 project is finalized.

22 23 **3.12 DOCUMENTATION OF GUIDANCE MEMORANDUM #3** 24 **ANALYSES**

25
26 The analyses conducted to determine whether or not existing legal sources of water have
27 been eliminated or transferred and whether levels of service for flood protection will be
28 reduced under the Savings Clause of section 601(h)(5) of WRDA 2000 will be documented.

29
30 For PIRs, a summary of the analysis of whether existing legal sources of water have been
31 eliminated or transferred should be included in the Plan Implementation section of the PIR in
32 the sub-section entitled “Effects on Existing Legal Sources of Water” (See Guidance
33 Memorandum #1, Attachment 1-C “PIR Outline”). More detailed information about the
34 analysis should be placed in Annex C - Analyses Required by Federal and State Law in the
35 section entitled “Savings Clause Analyses.”

36
37 A summary of the analysis of whether existing levels of service for flood protection have
38 been reduced should be included in the Plan Implementation section of the PIR in the sub-
39 section entitled “Effects on Level of Service for Flood Protection.” More detailed
40 information about the analyses should be placed in Annex C - Analyses Required by Federal
41 and State Law in the section entitled “Savings Clause Analyses.”

42
43 For to the preliminary and Final Project Operating Manuals and the System Operating
44 Manual, the Savings Clause analyses of whether existing legal sources of water have been
45 eliminated or transferred and the analysis of whether existing levels of service for flood

1 protection have been reduced should be documented in an appropriate section of the
2 Operating Manual.

ATTACHMENT 3-A OTHER ANALYSES AND PROTECTIONS FOR THE NATURAL SYSTEM

6 The protection provided by the Savings Clause in section 601(h)(5) of WRDA 2000 is
7 limited to protecting sources of water identified as of the date of enactment of WRDA 2000,
8 such as those for the natural system, from elimination or transfer by CERP projects. Projects
9 that will provide beneficial water for the natural system—Modified Water Deliveries to ENP
10 and the 1994 C-111 GRR modifications to the C&SF Project—were not included in the
11 assumptions for quantifying the natural system’s existing legal sources of water because the
12 CSOP process, which will determine the operations of these features, was not completed as
13 of the date of enactment of WRDA 2000. For the purpose of the Savings Clause evaluation,
14 these projects are considered intervening non-CERP activities.

16 The purpose of this attachment is to make the PDT aware that there are other analyses
17 besides the Savings Clause which provide protection for the natural system for intervening
18 non-CERP activities such as the Modified Water Deliveries to ENP Project and the C-111
19 Project,. PDTs will consider these intervening non-CERP activities that benefit the natural
20 system in the following ways:

- 21
22
23
24
25
26
27
28
29
30

38
39
40
41
42
43
44
45
46
- **Evaluation of non-CERP activity benefits by WRDA 2000 Section 601(f):** Section 601(f)(2) of WRDA 2000 requires that the proposed activity be justified by the environmental benefits derived by the South Florida ecosystem. This will require consistency of the project with the benefits provided by existing non-CERP activities and the Future Without CERP Baseline identified in the Plan.
 - **Evaluation of non-CERP activity benefits by “optimizing” process in the Programmatic Regulations:** The Programmatic Regulations (33 CFR 385.26(b)) require that, in preparing a PIR, the USACE and the non-Federal sponsor follow a formulation and evaluation process for alternative plans. Section 601 of WRDA 2000 mandates that this process will optimize the project’s contributions towards achieving the benefits of the Plan. Achieving the benefits of the Plan assumes that the benefits provided by non-CERP activities, like the Modified Water Deliveries, C-111, Critical Restoration Projects (pursuant to WRDA 1996), and the Everglades Construction projects, and other elements of the Future Without CERP Baseline described in the Plan are necessary to achieve the benefits of the Plan.
 - **Evaluation of non-CERP activity benefits by NEPA analysis:** The environmental effects of proposed CERP projects will be evaluated under NEPA. NEPA requires a comparison of a range of alternative plans with conditions that will exist if no action is taken.
 - **Evaluation of non-CERP activity benefits by the Fish and Wildlife Coordination Act, the Endangered Species Act, the Coastal Zone Management Act, and other Federal laws:** The environmental effects of proposed CERP projects on fish and

1 wildlife resources available at the time of the PIR will be evaluated under the Fish
2 and Wildlife Coordination Act, the Endangered Species Act, the Coastal Zone
3 Management Act, and other Federal laws. This evaluation will consider any loss of
4 benefits to fish and wildlife, any impacts on endangered or threatened species, and
5 any impacts on resources of Florida's coastal zone, including benefits provided by
6 non-CERP activities, even though they did not exist on date of enactment.
7

- 8 • **Evaluation of non-CERP activities benefits by Florida law:** The environmental
9 effects of proposed CERP projects will be evaluated under applicable Florida laws,
10 including minimum flows and levels, and F.S. section 373.1501. For example, the
11 Modified Water Delivery Project to ENP and the 1994 GRR modifications to the C-
12 111 Canal projects both were included in the Future Without CERP Baseline and
13 were assumed by Congress to be constructed and operational before related Plan
14 projects become operational. They are part of the framework Plan, as well as the
15 benefits provided by Florida's Everglades Construction Project, and the water
16 treatment requirements of the 1994 Everglades Forever Act.
17

1
2 **ATTACHMENT 3-B**
3 **OTHER ANALYSES AND PROTECTIONS FOR OTHER WATER-**
4 **RELATED NEEDS**
5

6 The protection provided by the Savings Clause in section 601(h)(5) of WRDA 2000 is
7 limited to protecting existing legal sources of water identified as of the date of enactment of
8 WRDA 2000 for the specified user classifications. In addition, the primary State authority
9 regarding the implementation of CERP is Chapter 373, F.S., provides assurances that
10 implementation of CERP will not have adverse affects. These provisions provide
11 responsibility to the State, including the SFWMD and the FDEP, to ensure restoration of the
12 Everglades and the protection of existing legal uses of water and existing levels of flood
13 protection when designing and implementing CERP project components.
14

15 Assurances are provided under State law requiring that CERP be used as a “guide and
16 framework ... to:... 2. ensure that the project components will be implemented to achieve the
17 purposes of the Federal Water Resources Development Act of 1996 that include restoring,
18 preserving and protecting the South Florida ecosystem, ...and providing such features as are
19 necessary to meet the other water-related needs of the region, including flood control, the
20 enhancement of water supplies, and other objectives served by the project” (section
21 373.470(3)(b)2., F.S).
22

23 Section 373.1501(2), F.S., in part, provides that CERP components must be implemented
24 through appropriate processes under Chapter 373 and consistent with the balanced policies
25 and purposes of Chapter 373, F.S. Specifically, section 373.1501(5) provides assurances to
26 natural systems, existing legal users and for flood protection, including requirements that
27 SFWMD has for each project component:

- 28 a. Analyze and evaluate all needs to be met in a comprehensive manner and consider all
29 applicable water resource issues, including water supply, water quality, flood
30 protection, threatened and endangered species, and other natural system and habitat
31 needs.
- 32 b. Consistent with Chapter 373, the purposes for the Restudy provided in the Water
33 Resources Development Act of 1996, and other applicable Federal law, provide
34 reasonable assurances that the quantity of water available to existing legal users shall
35 not be diminished by implementation of project components so as to adversely impact
36 existing legal users, that existing levels of service for flood protection will not be
37 diminished outside the geographic area of the project component, and that water
38 management practices will continue to adapt to meet the needs of the restored natural
39 environment.
40

41 Prior to executing a PCA, the SFWMD must develop a PIR with the USACE to address the
42 requirements in section 373.1501, F.S., and to obtain approval under section 373.026, F.S.,
43 from the FDEP. This ensures that the PIR will be sufficient to meet both State, as well as
44 Federal, law requirements for implementing a CERP project.
45
46

1 **Definition of Existing Legal Uses Pursuant to Chapter 373, F.S.**

2
3 As explained above, State law protects existing legal uses of water when implementing
4 CERP. Permitted consumptive uses and domestic water uses (which are exempt from
5 requirements to obtain a permit) have the legal status of an “existing legal use.” The existing
6 legal use is defined by the consumptive use permit authorizing the use of a specified source
7 to meet an identified reasonable-beneficial demand for water for a limited duration. They
8 receive the permits pursuant to the statutes and rules set forth in Part II of Chapter 373, F.S.
9 The existing legal use is conditioned to ensure that the consumptive use activities under the
10 permit continue to be conducted in accordance with Chapter 373, F.S. Unauthorized,
11 including unpermitted, consumptive uses do not constitute an “existing legal use” and are not
12 protected by the statute.
13

14 **Other Chapter 373 Tools for Protecting Existing Legal Uses of**
15 **Water**

16
17 Chapter 373, F.S., addresses the protection of existing legal uses in several places. Section
18 373.171, F.S., provides that no rule or order of the water management district shall require
19 modification of an exiting legal use unless such use is detrimental to other water users or to
20 the water resources of the state. In addition, there are limited grounds upon which revocation
21 of consumptive use permits can occur, as set forth in section 373.243, F.S., including willful
22 violation of permit conditions and submission of false material information required under
23 law.
24

25 Existing legal uses of water are also protected when adopting water reservations pursuant to
26 section 373.223(4), F.S. Specifically, existing legal uses are protected so long as they are
27 “not contrary to the public interest.” This public interest balancing is conducted by the
28 Governing Board of the water management district when establishing a reservation. For
29 CERP project reservations, section 373.1501 provides additional direction for protection of
30 existing legal uses.
31

32 Furthermore, existing legal use rights are considered when implementing water shortage
33 declarations under section 373.246, F.S. Specifically, under this section, water supplies are to
34 be equitably distributed during droughts so as to protect water resources from serious harm
35 and to reasonably meet the continued demands of the permitted users. This is commonly
36 referred to as the “shared adversity” standard, in which both existing legal uses and water
37 resources share in the adversity that occurs during water shortages. These provisions are
38 implemented through water management district rules, including the SFWMD water shortage
39 plan set forth in Chapter 40E-21, F.A.C.

6
7
8
9

ATTACHMENT 3-C OTHER ANALYSES OF FLOOD PROTECTION TO BE CONDUCTED IN ADDITION TO THE SAVINGS CLAUSE

6 Analysis of flood protection under the Savings Clause compares the proposed CERP project
7 with conditions existing at a specific point in time, the date of enactment of WRDA 2000.
8 The Savings Clause analysis is separate from, and different than, each of the following. All
9 of these analyses may require additional analysis of flood protection in the PIR:

- 10 • NEPA analysis of impact of alternative plans on the Next-Added Increment Baseline
11 (“no action plan”). This analysis compares the impact of the proposed CERP project
12 to conditions existing at a different point in time than the Savings Clause. Under
13 NEPA, alternative plans are compared to the no-action alternative.
14 • Takings analysis. This compares the impact of the proposed component to
15 constitutional property rights, which may or may not be related to levels of service for
16 flood protection at the time of enactment of WRDA 2000.
17

18 **Section 373.1501 analysis:** The Programmatic Regulations, 33 CFR section 385.15, requires
19 that “PIRs will include such information and analyses, consistent with this part, as are
20 necessary to facilitate review and approval of projects by the SFWMD and the State pursuant
21 to the requirements of Florida law.” The State requirements are different in several ways
22 from the Federal law. The current Florida law (F.S. 373.1501[d]), in part, requires the non-
23 Federal sponsor to provide “reasonable assurances” that “the existing levels of service for
24 flood protection will not be diminished outside the geographic area of the Plan project
25 component.”
26

27 **Consideration of additional flood protection under 33 CFR Section 385.37(c):** This
28 section of the Programmatic Regulations provides that “As appropriate, the USACE and the
29 non-Federal sponsor shall consider opportunities to provide additional flood protection,
30 consistent with restoration of the natural system, and the provisions of section 601(f)(2)(B) of
31 WRDA 2000 and other applicable laws.” This comparison is different than, and in addition
32 to, the Savings Clause analysis.
33

**ATTACHMENT 3-D
PROCEDURE FOR MINIMUM DELIVERIES TO EVERGLADES
NATIONAL PARK WATER ACCOUNTING**

The 1970 Minimum Deliveries to Everglades National Park Act (PL 91-282) “requires that the [C&SF] project deliver to the park annually not less than 315,000 acre-feet, or 16.5 percent of total water deliveries from the project, whichever is less.” Monthly minimum deliveries to three parts of the park totaling the 315,000 acre-feet were specified.

It is the intent of the Modified Water Deliveries to Everglades National Park Project and the CERP to change the distribution of water set forth in the Minimum Deliveries Act and provide a more natural hydrologic regime to Everglades National Park. Since it has been recognized that the distribution of water in the Minimum Deliveries Act does not constitute a natural hydrologic regime, the Minimum Deliveries Act will not be utilized for purposes of the Savings Clause. Although it is not a plan formulation objective, it is desirable to compare the C&SF Project delivery quantities to Everglades National Park with the quantities of water in the Minimum Deliveries Act by undertaking the following accounting procedure for each project that could affect water deliveries to Everglades National Park:

For each month, the sum of deliveries through the S-12 A, B, C, and D structures into Shark River Slough, into Taylor Slough, and into the Eastern Panhandle should be compared to the quantities shown in Table 3-D-1 for total water deliveries to Everglades National Park.

Table 3-D-1: Minimum Monthly Deliveries to Everglades National Park

Month	Quantity (Acre-Feet)			Total
	S-12 (A-D)	Taylor Slough	Eastern Panhandle	
January	22,000	740	1,540	24,280
February	9,000	370	630	10,000
March	4,000	185	290	4,475
April	1,700	185	110	1,995
May	1,700	370	110	2,180
June	5,000	6,660	340	12,000
July	7,400	7,400	510	15,310
August	12,200	2,960	860	16,020
September	39,000	5,920	2,690	47,610
October	67,000	7,770	4,630	79,400
November	59,000	3,700	4,060	66,760
December	32,000	740	2,230	34,970
TOTAL	260,000	37,000	18,000	315,000

1 **ATTACHMENT 3-E**
2 **EFFECT OF INTERVENING NON-CERP ACTIVITIES ON EXISTING**
3 **LEGAL SOURCES OF WATER**
4
5

6 As described in section 3.8 of this Guidance Memorandum, when the Pre-CERP Baseline
7 conditions have already been altered by an intervening non-CERP activity, the PDT applies a
8 different analysis. In general, CERP will deal with intervening non-CERP activities as
9 follows:

- 10 • The Savings Clause does not require CERP to make up for reductions in quantity and
11 quality of existing legal sources of water or levels of service for flood protection
12 caused by intervening non-CERP activities, but it does prohibit CERP projects from
13 further reductions.
- 14 • The Savings Clause does not prohibit CERP from reducing quantity and quality of
15 existing legal sources of water or levels of service for flood protection that were
16 increased by intervening non-CERP activities, but it does prohibit CERP projects
17 from reducing those increases below those in place at the date of enactment of
18 WRDA 2000.

19
20 The PDT must make a determination in the PIR as to this elimination or transfer by the
21 intervening non-CERP activities. The following examples are provided as guidance to the
22 PDT for analyzing whether the project will eliminate or transfer quantities of existing legal
23 source water in cases where the Pre-CERP Baseline hydrology has been altered by an
24 intervening non-CERP activity:

25
26 **Example (1):**

27 After date of enactment of WRDA 2000, a non-CERP activity is implemented in accordance
28 with applicable law. The non-CERP activity eliminates or transfers the water quantity or
29 quality of an existing legal source that existed on the date of enactment. The proposed CERP
30 project does not change the elimination or transfer caused by the intervening non-CERP
31 activity.

32 Q. Is this an “elimination or transfer of an existing legal source” under the Savings Clause?

33 A. No. The existing legal source quantity or quality was eliminated or transferred by the non-
34 CERP activity, not by implementation of CERP. The statute does not require the
35 proposed CERP project to restore the quantity or quality that existed on date of enactment
36 after that quantity or quality had been changed by an intervening project.

37 **Example (2):**

38 After date of enactment, a non-CERP activity is implemented in accordance with applicable
39 law. The non-CERP activity eliminates or transfers the existing legal source quantity or
40 quality that existed on the date of enactment. A proposed CERP project would increase the

1 quantity or quality above that of the non-CERP activity, but it would not restore the existing
2 legal source quantity or quality existing on date of enactment.

3 Q. Is this an “elimination or transfer” under the Savings Clause?

4 A. No. The elimination or transfer of quantity or quality was caused by the non-CERP
5 activity, not by implementation of CERP. The statute does not require the CERP project
6 to restore the existing legal source quantity or quality that existed on date of enactment
7 after it had been changed by an intervening non-CERP activity.

8 **Example (3):**

9 After date of enactment, a non-CERP activity is implemented. The non-CERP activity
10 provides an improved quantity or quality of water than existed on the date of enactment. A
11 proposed CERP project would eliminate or transfer the existing legal source quantity or
12 quality below that provided by the non-CERP activity but still provide a higher existing legal
13 source quantity or quality than on the date of enactment.

14 Q. Is this an “elimination or transfer” under the Savings Clause?

15 A. No. There is no elimination or transfer of an existing legal source quantity or quality from
16 the date of enactment. The Savings Clause does not prohibit a reduction in the non-CERP
17 improvement in existing legal source water quantity or quality provided by the
18 intervening non-CERP activity because the increased quantity or quality was not in
19 existence on the date of enactment. However, the PDT should be aware that there might
20 be other reasons why the proposed CERP project cannot reduce the increased water
21 quantity or quality (see Attachments 3-A and 3-B).

22 **Example (4):**

23 After date of enactment, a non-CERP activity is implemented in accordance with applicable
24 law. The non-CERP activity eliminates or transfers an existing legal source quantity or
25 quality that existed on the date of enactment. A proposed CERP project would eliminate or
26 transfer that existing legal source quantity or quality that existed on date of enactment even
27 more than the non-CERP activity.

28 Q. Is the additional elimination or transfer of the existing legal source quantity or quality an
29 “elimination or transfer” under the Savings Clause?

30 A. Yes. The initial elimination or transfer was not due to implementation of the CERP
31 project; the Savings Clause does not require the proposed CERP project to restore that
32 existing legal source quantity or quality. However, the additional elimination or transfer
33 was due to implementation of the CERP project. The intent of the Savings Clause
34 prohibits the proposed CERP project from eliminating or transferring the existing legal
35 source quantity or quality more than it had been already eliminated or transferred by the
36 non-CERP activity.

1

2 **Example (5):**

3 After date of enactment, a non-CERP activity is implemented in accordance with applicable
4 law. The non-CERP activity provides a greater quantity or quality than existed on the date of
5 enactment. A proposed CERP project would eliminate the increased quantity or quality
6 provided by the non-CERP activity, but would not reduce the benefit from that which existed
7 on the date of enactment.

8 Q. Is this an “elimination or transfer” under the Savings Clause?

9 A. No. The Savings Clause prohibits the implementation of CERP from eliminating or
10 transferring the existing legal source quantity or quality existing on the date of enactment.
11 The Savings Clause does not prohibit elimination or transfer of the non-CERP activity
12 increased quantity or quality because it was not in existence on the date of enactment.
13 The proposed CERP project is not required to restore the increased quantity or quality
14 provided by the non-CERP activity. However, the PDT should be aware that there might
15 be other reasons why the proposed CERP project cannot reduce the increased water
16 quantity or quality (see Attachments 3-A and 3-B).

17 **Example (6):**

18 After date of enactment, a non-CERP activity is implemented in accordance with applicable
19 law. The non-CERP activity provides an increased water quantity or quality than existed on
20 the date of enactment. A proposed CERP project not only would eliminate and transfer the
21 greater water quantity or quality provided by the non-CERP activity, but also would
22 eliminate or transfer the existing legal source water quantity or quality existing on the date of
23 enactment.

24 Q. Is this an “elimination or transfer” under the Savings Clause?

25 A. Yes. The elimination or transfer of the existing legal source quantity or quality in
26 existence on date of enactment is due solely to implementation of the CERP project. The
27 Savings Clause prohibits implementation of the CERP project from eliminating a legal
28 source quantity or quality in existence on date of enactment. The Savings Clause does not
29 prohibit an elimination or transfer of the non-CERP quantity or quality because it was not
30 in existence on the date of enactment. The proposed CERP project is not required to
31 restore the quantity or quality provided by the non-CERP activity. However, the PDT
32 should be aware that there might be other reasons why the proposed CERP project cannot
33 reduce the increased water quantity or quality (see Attachments 3-A and 3-B).

34

35 **Note:** It is important for the PDT to note that the Savings Clause analyses described in this
36 Guidance Memorandum pertain specifically to the analyses required for compliance with the
37 Savings Clause of section 601(h)(5) of WRDA 2000. The PDT should conduct other

- 1 appropriate analyses to determine if the selected alternative plan will affect other rights
- 2 provided under Federal or State law.

**ATTACHMENT 3-F
EFFECT OF INTERVENING NON-CERP ACTIVITIES ON REDUCTION
IN LEVELS OF SERVICE FOR FLOOD PROTECTION**

The Savings Clause applies to reduction in levels of service for flood protection only caused by “implementation of the Plan.” The PDT should not assume that differences between the Initial Operating Regime and the Existing Conditions Baseline are due to implementation of the Plan. The PDT must use some appropriate method to identify any reduction in levels of service caused by implementation of non-CERP activities since December 2000.

After the PDT has determined the reduction in levels of service caused by the intervening non-CERP activity, the PDT must then determine if the CERP project will further reduce the levels of service from that reduction caused by the intervening non-CERP activity. If the CERP project will significantly impact levels of service beyond those caused by the non-CERP activity, guidance is provided in Attachment 3-I as to next steps for the PDT.

The following examples for the effect of intervening non-CERP activities on the Savings Clause analysis for levels of service for flood protection are provided:

Example (1):

After date of enactment of WRDA 2000, a non-CERP activity is implemented in accordance with applicable law. The non-CERP activity reduces the level of service that existed on the date of enactment. The proposed CERP project does not change the level of service provided by the intervening non-CERP activity.

Q. Is this a “reduction in levels of service for flood protection” under the Savings Clause?

A. No. The level of service was reduced by the non-CERP activity, not by implementation of CERP. The statute does not require the proposed CERP project to restore the level of service that existed on date of enactment after that level of service had been changed by an intervening project.

Example (2):

After date of enactment, a non-CERP activity is implemented in accordance with applicable law. The non-CERP activity reduces the level of service that existed on the date of enactment. A proposed CERP project would increase the level of service above that of the non-CERP activity, but it would not restore the levels of service existing on date of enactment.

Q. Is this a “reduction in levels of service for flood protection” under the Savings Clause?

A. No. The level of service was reduced by the non-CERP activity, not by implementation of the Plan. The statute does not require the CERP project to restore the level of service that

1 existed on date of enactment after it had been changed by an intervening non-CERP
2 activity.

3 **Example (3):**

4 After date of enactment, a non-CERP activity is implemented in accordance with applicable
5 law. The non-CERP activity provides a greater flood protection level of service than existed
6 on the date of enactment. A proposed CERP project would reduce the level of service below
7 the non-CERP activity but still provide a higher level of service than on the date of
8 enactment.

9 Q. Is this a “reduction in levels of service for flood protection” under the Savings Clause?

10 A. No. There is no reduction in level of service from the date of enactment. The Savings
11 Clause does not prohibit a reduction in the non-CERP level of service because it was not
12 in existence on the date of enactment. However, the PDT should be aware that there may
13 be other reasons why the proposed CERP project cannot reduce the increased level of
14 service.

15 **Example (4):**

16 After date of enactment, a non-CERP activity is implemented in accordance with applicable
17 law. The non-CERP activity reduces the flood protection level of service that existed on the
18 date of enactment. A proposed CERP project would further reduce the level of service that
19 existed on date of enactment even more than the non-CERP activity.

20 Q. Is the additional reduction in the level of service a “reduction in levels of service for flood
21 protection” under the Savings Clause?

22 A. Yes. The initial reduction in level of service was not due to implementation of the CERP
23 project; the Savings Clause does not require the proposed CERP project to restore that
24 level of service. However, the additional reduction in level of service was due to
25 implementation of the CERP project. The intent of the Savings Clause prohibits the
26 proposed CERP project from reducing the level of service more than it had been reduced
27 by the non-CERP activity.

28 **Example (5):**

29 After date of enactment, a non-CERP activity is implemented in accordance with applicable
30 law. The non-CERP activity provides a greater flood protection level of service than existed
31 on the date of enactment. A proposed CERP project would eliminate the increased level of
32 service provided by the non-CERP activity, but would not reduce the level of service from
33 that which existed on the date of enactment.

34 Q. Is this a “reduction in levels of service for flood protection” under the Savings Clause?

1 A. No. The Savings Clause prohibits the implementation of CERP from reducing the level of
2 service existing on the date of enactment. The Savings Clause does not prohibit a
3 reduction in the non-CERP level of service because it was not in existence on the date of
4 enactment. The proposed CERP project is not required to restore the level of service
5 provided by the non-CERP activity. However, the PDT should be aware that there may
6 be other reasons why the proposed CERP project cannot reduce the increased level of
7 service.

8 **Example (6):**

9 After date of enactment, a non-CERP activity is implemented in accordance with applicable
10 law. The non-CERP activity provides a greater flood protection level of service than existed
11 on the date of enactment. A proposed CERP project not only would eliminate the greater
12 level of service provided by the non-CERP activity, but also would reduce the level of
13 service existing on date of enactment.

14 Q. Is this a “reduction in levels of service for flood protection” under the Savings Clause?

15 A. Yes. The reduction in the level of service in existence on date of enactment is due solely
16 to implementation of the CERP project. The Savings Clause prohibits implementation of
17 the CERP project from reducing the level of service in existence on date of enactment.
18 The Savings Clause does not prohibit a reduction in the non-CERP level of service
19 because it was not in existence on the date of enactment. The proposed CERP project is
20 not required to restore the level of service provided by the non-CERP activity. However,
21 the PDT should be aware that there may be other reasons why the proposed CERP project
22 cannot reduce the increased level of service.

23
24 **Note:** It is important for the PDT to note that the Savings Clause analyses described in this
25 Guidance Memorandum pertain specifically to the analyses required for compliance with the
26 Savings Clause of section 601(h)(5) of WRDA 2000. The PDT should conduct other
27 appropriate analyses to determine if the selected alternative plan will affect other rights
28 provided under Federal or State law.

5 **Step (1).** Was there a Water Management District, Chapter 298 District, county or municipal
6 flood protection project or stormwater management system constructed and operating in the
7 proposed CERP project area on the date of enactment of WRDA 2000 (i.e. December 11,
8 2000)?
9

10 If the answer is “no,” stop. Go to step (2).
11

12 If “yes,” determine all the facts and circumstances, and determine if this qualifies as a
13 level of service for flood protection “in accordance with applicable law” under this
14 Guidance Memorandum. Then go to steps (2) and (3)
15

16 **Step (2).** On the date of enactment of WRDA 2000, was there a Federal or State flood
17 protection project in the area affected by the proposed CERP project component?
18

19 If there was no Federal, State or local level of service for flood protection, stop. There is
20 no “level of service for flood protection” issue. Go to step (12).
21

22 If “yes,” go to step (3).
23

24 **Step (3).** Determine the actual stage-duration curve(s) for the flood protection or stormwater
25 management project as it was constructed and operating on the date of enactment of WRDA
26 2000. As required by the Programmatic Regulations, consider the operational conditions
27 included in the Pre-CERP Baseline, and other appropriate analysis, in determining the actual
28 stage-duration curve. Go to step (4).
29

30 **Step (4).** Determine the stage-duration curve(s) for the “with CERP project” alternative
31 being considered. Go to step (5).
32

33 **Step (5).** Is there a difference between (3) and (4)?
34

35 If “no,” stop. Go to step (11)
36

37 If “yes,” go to step (6).
38

39 **Step (6).** Is the difference both significant and adverse to current land uses in the proposed
40 CERP project component area?
41

42 If “no,” stop. Go to step (11).
43

44 If “yes,” go to step (7).
45

1 **Step (7).** Is the difference both significant and adverse to land uses that were in existence in
2 the proposed CERP project component area on the date of enactment of WRDA 2000?

3
4 If “no,” stop. Go to step (11).

5
6 If “yes,” go to step (8).

7
8 **Step (8).** Are significant and adverse changes in the levels of service for flood protection due
9 to changes in land use or to implementation of a non-CERP activity?

10
11 If there are no significant and adverse changes caused solely by the proposed CERP
12 project component, stop. Go to step (11)

13
14 If there are significant and adverse differences caused by the proposed CERP project
15 component, go to step (9).

16
17 **Step (9).** (a) Can the proposed alternative be changed to avoid either significant or adverse
18 effects, or (b) can a mitigation feature (e.g. pumps, retention areas, and levees) be added to
19 prevent either significant or adverse effects on the “levels of service for flood protection”?

20
21 If you determined the answer to either (a) or (b) as “yes,” determine if the proposed
22 alternative is still justified and cost-effective. CERP and the Programmatic Regulations
23 require projects to be justified and cost-effective (WRDA 2000 section 601(f)(2)).

24
25 If the redesigned alternative is still justified and cost-effective, stop. Change or mitigate
26 the proposed alternative for the CERP component accordingly. Then go to step (11).

27
28 If the redesigned alternative is not justified and/or cost-effective, then go to step (10).

29
30 If both (a) and (b) answers are “no,” stop. Eliminate this alternative.

31
32 **Step (10).** If redesign would not be cost-effective, consider acquisition of affected property.

33
34 If affected property cannot be acquired or if the alternative would no longer be justified
35 or cost-effective if property were acquired, stop. Eliminate this alternative.

36
37 If the alternative is still justified or cost-effective, go to step (11)

38
39 **Step (11).** Determine if smaller scale modeling must be done to determine flood impacts on a
40 site-specific basis.

41
42 Regional models such as the SFWMM may be used for the initial screening. Many CERP
43 components are regional in scale. The PDT may use their best professional judgment to
44 determine when smaller scale site-specific modeling is needed to determine whether there
45 is a reduction in “levels of service for flood protection.” Smaller sub-regional projects
46 may be a likely candidate for smaller scale modeling.

1
2
3
4
5
6
7
8
9
10
11
12
13

If regional modeling of a proposed alternative shows a negative direction in those performance measures, that's an indication that more site specific modeling is needed.

If you determine that no further modeling is necessary, stop. There is no level of service for flood protection issue. Go to step (12).

If you determine that modeling on a smaller scale/more site-specific basis must be done in addition to the regional modeling, repeat steps (3)-(10), then go to step (12).

Step (12). Level of service for flood protection analysis complete.

1 **SECTION 4: GUIDANCE MEMORANDUM #4**
2 **IDENTIFYING WATER MADE AVAILABLE FOR THE NATURAL**
3 **SYSTEM AND FOR OTHER WATER-RELATED NEEDS**
4
5

6 **4.1 PURPOSE**
7

8 This Guidance Memorandum provides instructions on how to identify the water made
9 available for the natural system and for other water-related needs. This Guidance
10 Memorandum also provides instructions on how to identify water to be reserved or allocated
11 for the natural system. It is important to note that this Guidance Memorandum is to be used
12 by the PDT after the identification of a selected alternative plan, as described in Guidance
13 Memorandum #2. The procedures described in this Guidance Memorandum are not intended
14 to be used to optimize the performance of the project nor to document all the types of
15 benefits associated with the project.
16

17 **4.2 APPLICABILITY**
18

19 This Guidance Memorandum applies to PIRs for all CERP projects. Identifying water made
20 available by the project and identifying water to be reserved or allocated for the natural
21 system is required by section 601 of WRDA 2000 and the Programmatic Regulations. The
22 PDT will identify the water necessary to achieve the benefits of the project – both water
23 existing in the natural system and for other water-related needs prior to implementation of
24 CERP and water made available to the natural system and for other water-related needs by
25 the CERP project. These analyses will be conducted on the selected alternative plan.
26

27 **4.3 LEGAL FRAMEWORK FOR IDENTIFYING WATER**
28

29 The legal framework for identifying water made available by each project for the natural
30 system and for other water-related needs is provided by section 601 of WRDA 2000, the
31 Programmatic Regulations, and the CERP Assurance of Project Benefits Agreement of
32 January 9, 2002 (also known as the President-Governor Agreement). After water made
33 available from each project is identified, section 601 of WRDA 2000 and the Programmatic
34 Regulations contain specific assurances for the water for the natural system. Specifically,
35 section 601 of WRDA 2000 requires that the State reserve or allocate this water from
36 availability for consumptive use. While the reservation or allocation of water is a process
37 solely undertaken by the State, section 601 of WRDA 2000 and the Programmatic
38 Regulations require that this reservation or allocation be based on the identification of water
39 made available for the natural system. Furthermore, the State has elected to use its legal
40 authority to protect water existing in the natural system that is identified in each PIR that is
41 necessary to achieve the benefits of the project. See Attachment 4-B for a description of the
42 tools available under State law for providing assurances.

1 **4.4 PROJECT IMPROVEMENTS IN WATER QUALITY**

2
3 In general, water quality must be considered for all CERP projects during project plan
4 formulation and evaluation. As a result, the requirements of this Guidance Memorandum to
5 address improvements in water quality necessary to ensure that water delivered by the Plan
6 meets applicable water quality standards have been addressed in the application of the plan
7 formulation and evaluation procedures of Guidance Memorandum #1 and Guidance
8 Memorandum #2, which resulted in the selected alternative plan to which the technical
9 methodologies in this Guidance Memorandum then apply. The requirement of section
10 385.35(b)(3)(i) of the Programmatic Regulations that the procedures in this Guidance
11 Memorandum ensure that any features to improve water quality are implemented in a manner
12 consistent with the WRDAs of 1996 and 2000 are included in Guidance Memorandum #2.

13
14 **4.5 KEY CONCEPTS FOR IDENTIFYING WATER**

15
16 **4.5.1 Achieving the Benefits of the Plan**

17
18 Both section 601 of WRDA 2000 and the Programmatic Regulations require that the
19 identification of water needed to achieve the benefits of the Plan be undertaken as part of
20 developing the Project Implementation Report. The process of identifying water is integral to
21 the specific assurances of section 601 of WRDA 2000 and ultimately to ensuring that the
22 overarching objective of the Plan – restoration, preservation, and protection of the south
23 Florida ecosystem while providing for other water-related needs of the region, including
24 flood protection and water supply – is met. This Guidance Memorandum specifies how the
25 identification of water will take place.

26
27 The assurances section of section 601 of WRDA 2000 and the Programmatic Regulations
28 require that all the water necessary to achieve the benefits of each project, and ultimately, the
29 Plan, be identified as each PIR is developed. The Programmatic Regulations (section
30 385.31[c]) further require that the total quantity of water that is expected to be generated by
31 implementation of the Plan be periodically updated.

32
33 In order to achieve the benefits of the Plan for the natural system, all the water necessary to
34 achieve the natural system benefits of each project will be identified in the PIR. This includes
35 both water available to the natural system prior to the implementation of the project which is
36 needed to achieve project benefits and the water made available for the natural system as a
37 result of the project. These two categories of water are both necessary to achieve the benefits
38 of the Plan, but are to be protected by the State of Florida using separate authorities. The
39 State has elected to use its authority to protect the existing water in the system that is
40 identified by each PIR as necessary to achieve the natural system benefits of each project.
41 The second category, water made available for the natural system that is identified by each
42 PIR, includes any changes the project makes in the quantity, timing, or distribution of water
43 which provides the benefits of the project. This is the water that will be reserved or allocated
44 by the State pursuant to section 601(h)(4)(A)(iii)(V) of WRDA 2000.

1 This Guidance Memorandum also sets forth the methodology for each PIR to identify the
2 water made available for other water-related needs. The State will then determine the use or
3 allocation thereof as appropriate.

4.5.1.1 The Relationship between Plan Formulation and the Identification of Water

8 This Guidance Memorandum specifies how the identification of water made available by the
9 project and the identification of water to be reserved or allocated for the natural system will
10 take place. Figure 4-1 illustrates the framework for assuring that the benefits of the CERP
11 project are achieved.

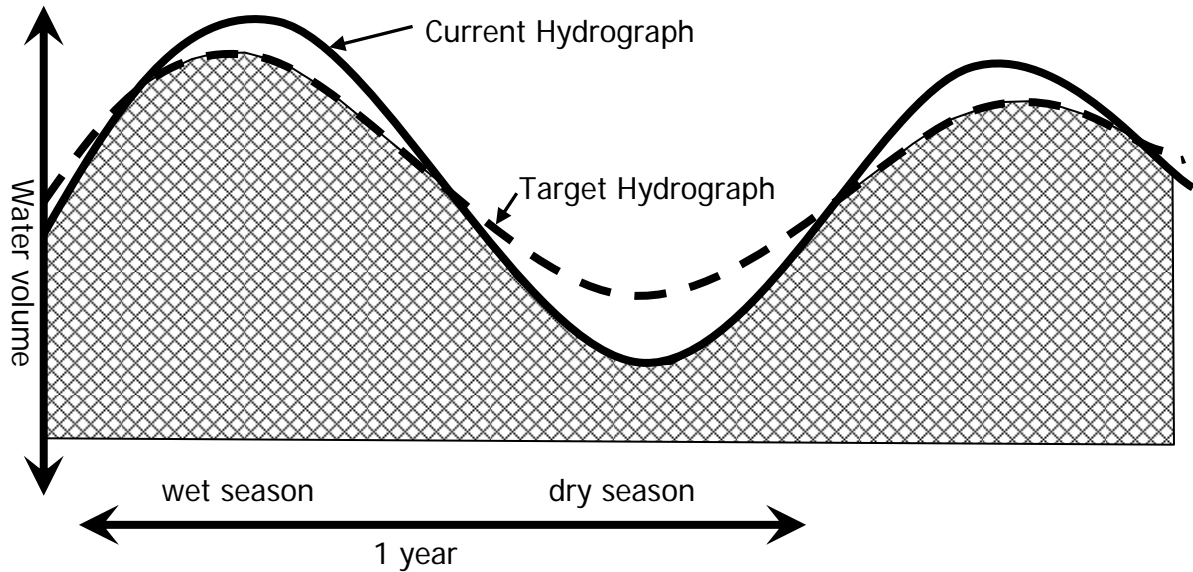

13
14
15 **Figure 4-1: Relationship between Identification of Water and Other PIR**
16 **Tasks**

19 The quantification of water made available by a project occurs after the selected alternative
20 plan has been identified from an array of alternative plans and the Initial Operating Regime
21 has been developed for this plan. Once the selected alternative plan has been identified and
22 the Initial Operating Regime developed, the procedures described in this Guidance
23 Memorandum will be used to quantify the amount of water that is made available by the
24 project for the natural system and for other water-related needs.

4.5.2 Water for Estuaries

28 Identification of water for estuaries is based on a determination of water that contributes to
29 meeting hydrologic, water quality, and ecologic targets for restoration of the estuary,
30 including salinity targets. These restoration targets should be based on ensuring a healthy,
31 sustainable population of fish and wildlife that can remain healthy and viable through natural
32 cycles of drought, flood, and population variation, and can continue on into the future as a
33 healthy, sustainable population. As measured by the restoration targets, fish and wildlife are
34 the native communities of fish and wildlife that use the habitat in its healthy state, not exotic,
35 invasive, or other species that have moved into an area because the habitat has become
36 degraded. Approved hydrologic, water quality, and ecologic performance measures for each
37 estuary should be utilized to measure fresh water quantities needed for the protection of fish

1 and wildlife in the estuary, versus that which may be harmful to it or otherwise not
2 contributing to the restoration targets for the estuary. Figure 4-2 illustrates the concept of
3 water meeting restoration targets for estuaries.
4

5  Water meeting restoration targets for estuaries

6
7 **Figure 4-2: Concept for Quantifying Restoration Flows to the Estuaries**

8
9
10 **4.5.3 Hydrologically Separate Basins**

11
12 Generally, the identification of water made available for the natural system and for other
13 water-related needs should be conducted at a system-wide level using available regional and
14 sub-regional hydrologic models. Some projects, such as Picayune Strand Restoration Project,
15 are hydrologically separate from the regional water management system. Projects that do not
16 affect regional water deliveries are exempt from the system-wide evaluations described in
17 this Guidance Memorandum. While these areas are too small to be quantified for identifying
18 water using current modeling tools, the benefits and performance improvements should be
19 described in the PIR using qualitative methods or quantitative methods, if possible.
20 Attachment 1-A of Guidance Memorandum #1 provides a procedure for determining whether
21 a project has system-wide or project-level effects and for determining the spatial extent of
22 project effects.

23
24 **4.5.4 Significant Natural System Areas located within Other Water-Related
25 Needs Basins**

26
27 Significant natural system areas located within basins identified as other water-related needs
28 basins (e.g., Pennsuco) that are affected by the selected alternative plan should be identified.

1 While these areas are too small to be quantified for identifying water using current modeling
2 tools, the benefits and performance improvements should be described in the PIR.

3 4 **4.6 IDENTIFYING WATER**

5
6 This section describes the analyses that the PDT is to use in identifying the total water
7 necessary to achieve the benefits of the project and the water made available by a project.

8 9 **4.6.1 Volume-Probability Analysis of IOR and NAI Condition**

10
11 For the purposes of this Guidance Memorandum, there are two concepts that need to be
12 addressed – the identification of the total water necessary to achieve the benefits of the
13 project and the water made available by the project. The Programmatic Regulations define
14 water made available as the “water expected to be generated pursuant to the implementation
15 of a Project of the Plan in accordance with the Project Implementation Report for that
16 Project.”

17
18 The identification of the total water necessary to achieve the benefits of the project will be
19 determined from the inflow volume-probability curves for two separate conditions – the
20 Initial Operating Regime (IOR) and the Next-Added Increment (NAI) Condition.

21
22 The identification of the water made available by the project will be determined from the
23 difference between the inflow volume-probability curves for two separate conditions – the
24 Initial Operating Regime (IOR) with the Existing Conditions Baseline and the Next-Added
25 Increment (NAI) Condition with the Next-Added Increment Baseline. The difference
26 between the Initial Operating Regime and the Existing Conditions Baseline is used to
27 quantify the volume of water that will be immediately available when the project becomes
28 operational and is the water that will be reserved or allocated by the State as identified in the
29 PIR. This comparison is necessary because physical and operational constraints may exist
30 temporarily in the system that prevents the attainment of all of the project’s projected
31 benefits immediately upon operation. Once these constraints are removed as modeled in the
32 Next-Added Increment simulations, the quantity of water made available is expected to
33 change. Furthermore, project operations would be expected to change due to a variety of
34 reasons, including adjustments to operations and the construction of other CERP and non-
35 CERP projects.

36
37 The total water necessary to achieve the benefits of the project and the water made available
38 by the project will be computed for each of the following basins of interest:

39 40 Everglades

- 41 • Water Conservation Area 1
- 42 • Water Conservation Area 2 (2A and 2B)
- 43 • Water Conservation Area 3 (3A and 3B)
- 44 • Big Cypress National Preserve
- 45 • Everglades National Park

1 Estuaries

- 2 • Caloosahatchee Estuary
- 3 • St Lucie Estuary
- 4 • Loxahatchee River
- 5 • Biscayne Bay
- 6 • Florida Bay

7
8 Other Water-Related Needs

- 9 • Lake Okeechobee
- 10 • Caloosahatchee River Basin
- 11 • St Lucie River Basin
- 12 • Everglades Agricultural Area
- 13 • Indian Prairie/Lake Shore Perimeter
- 14 • North Palm Beach and Southern Martin Counties (NPB/SMC)
- 15 • Lower East Coast Service Area 1
- 16 • Lower East Coast Service Area 2
- 17 • Lower East Coast Service Area 3

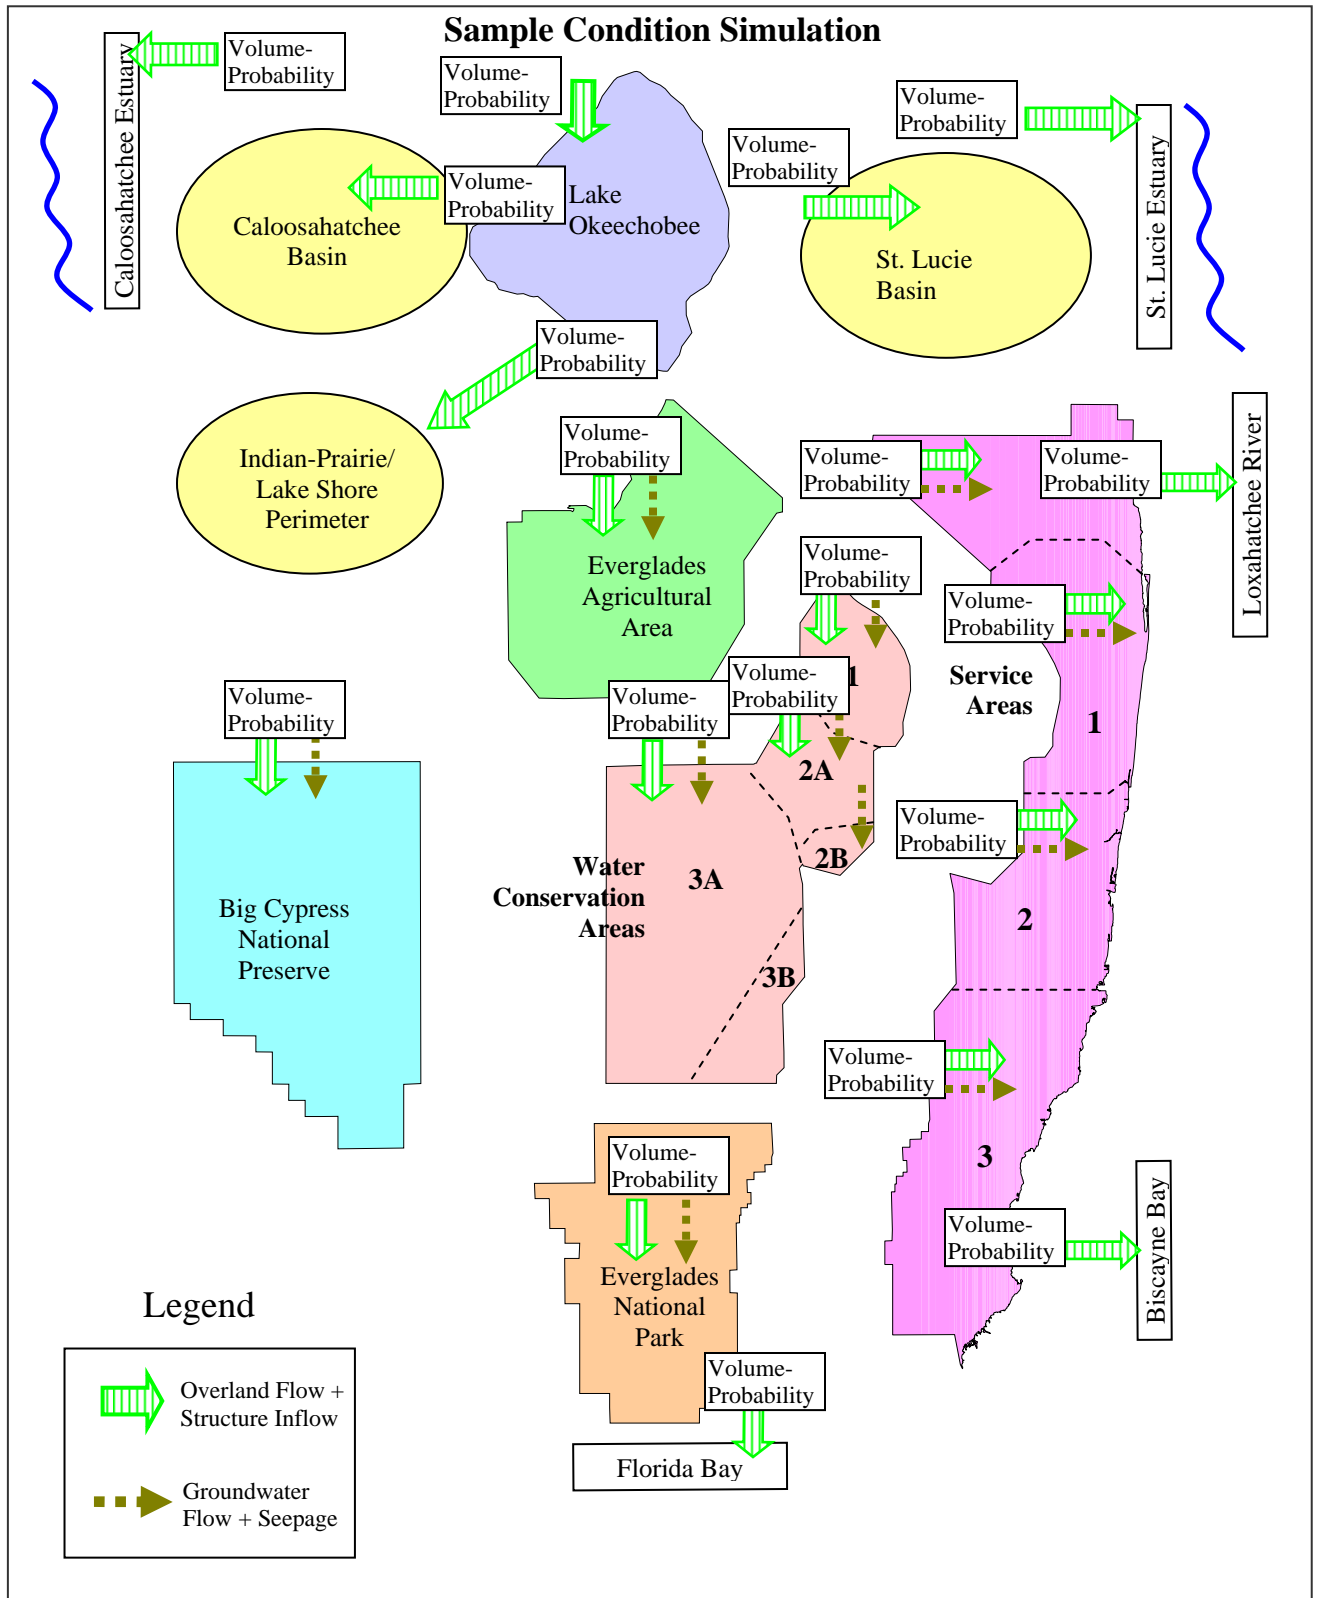

18
19 The volumes of inflow to each basin are to be calculated as the sum of all simulated
20 structural (e.g., pump stations, weirs, culverts, etc) and passive (e.g., bridges, overland flow,
21 etc) means of water conveyance or transfer from one basin to another basin. For the estuary
22 basins, the calculations must be based on determining water that contributes to meeting
23 hydrologic, water quality, and ecologic targets for restoration of the estuary, including
24 salinity targets (see section 4.5.2). Once water flows into a basin, it becomes part of that
25 basin. The inflow volumes into a particular basin should include structural flow, overland
26 flow, groundwater flow, and seepage. Figure 4-3 shows the basins of interest for which
27 inflows are to be calculated. A map similar to Figure 4-3 should be prepared for each
28 condition – Existing Conditions Baseline, Initial Operating Regime, Next-Added Increment
29 Baseline, and Next-Added Increment Condition.

30
31 The inflow volumes for each basin will be displayed as volume-probability curves for the
32 simulation period of record. The volume-probability curves rank the total annual cumulative
33 inflow into a basin from the lowest to the highest value for the period of simulation. Figure 4-
34 4 is an example of a volume-probability curve. For each volume probability curve, the 10%,
35 50% and 90% exceedence probability volumes will be identified.

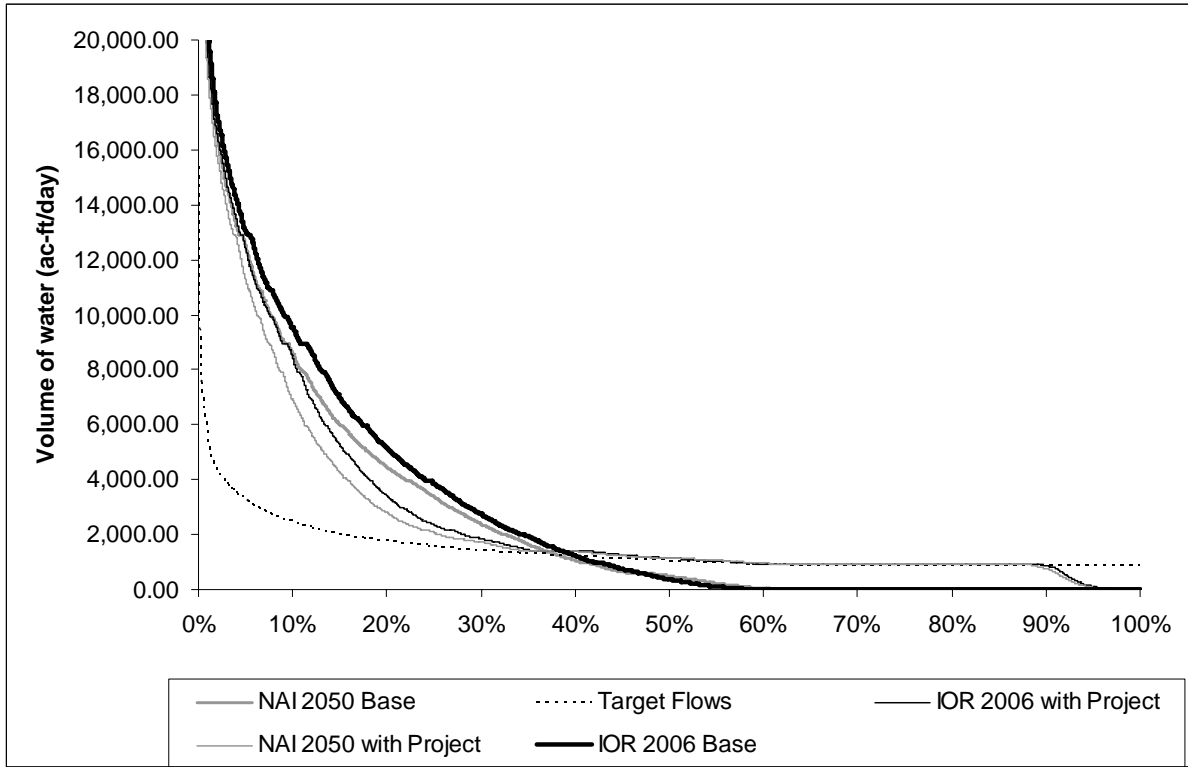

36
37 Two sets of difference curves will then be developed from the volume-probability curves.
38 The two sets of difference curves will be derived from comparison of the annual values for
39 the two conditions - Existing Conditions Baseline and IOR and NAI Baseline vs. NAI. The
40 results will then be sorted, ranked (from greatest to least), and plotted as difference curves.
41 The 10%, 50%, and 90% exceedance points on the difference curve will be identified for
42 each comparison and the water year for each of these points will be determined. The volumes
43 associated with that water year will then be identified for each of the two conditions from
44 which the difference curve was developed. Figure 4-5 is an example of difference curves.

45

**Figure 4-5: Example of Difference Curves for IOR and NAI to the Base
(Note: this example is for an estuary)**

4.6.2 Identifying Total Water and Water Made Available for the Natural System

The identification of the total water necessary to achieve the benefits of the project and the identification of water made available for the natural system is to be based on quantifying surface water and groundwater inflow to each affected natural system basin. For analysis purposes, these natural system basins are divided into two categories, Everglades and Estuaries. Natural system basins are listed below:

Everglades

- Water Conservation Area 1
- Water Conservation Area 2 (2A and 2B)
- Water Conservation Area 3 (3A and 3B)
- Big Cypress National Preserve
- Everglades National Park

Estuaries

- 1 • Caloosahatchee Estuary
- 2 • St Lucie Estuary
- 3 • Loxahatchee River
- 4 • Biscayne Bay
- 5 • Florida Bay

6
7 Together, the water identified for the Everglades and the Estuaries represent all the water that
8 is made available by the project for the natural system. The modeling comparison and
9 analysis for each category is explained in the following two sections.

10 11 **4.6.2.1 Everglades**

12
13 The total water necessary to achieve the benefits of the project and water made available for
14 the basins in the Everglades category (i.e., Water Conservation Area 1, Water Conservation
15 Area 2, Water Conservation Area 3, Big Cypress National Preserve, and Everglades National
16 Park) is to be identified. Inflow volumes for the Existing Conditions Baseline, the Initial
17 Operating Regime, the Next-Added Increment Baseline, and the Next-Added Increment
18 Condition will be computed and displayed as described in section 4.6.1.

19
20 From analysis of the inflows, volume-probability curves, and difference curves that are
21 generated, a summary table can be prepared displaying the locations as rows and the
22 differences between the IOR and Existing Conditions Baseline and the differences between
23 the Next-Added Increment Baseline and the Next-Added Increment Condition as columns for
24 the 10% exceedence probability, 50% exceedence probability, and 90% exceedence
25 probability. Example tables are shown in Figures 4-6 and 4-7.

26 27 **4.6.2.2 Estuaries**

28
29 Identification of water for estuaries is based on a determination of water that contributes to
30 meeting hydrologic, water quality, and ecologic targets for restoration of the estuary,
31 including salinity targets. These restoration targets should be based on ensuring a healthy,
32 sustainable population of fish and wildlife that can remain healthy and viable through natural
33 cycles of drought, flood, and population variation, and can continue on into the future as a
34 healthy, sustainable population. Consequently, the identification of water for estuary basins is
35 computed differently than Everglades basins. The total water necessary to achieve the
36 benefits of the project and the water made available for the natural system for estuary basins
37 (i.e., Caloosahatchee Estuary, St. Lucie Estuary, Loxahatchee River, Biscayne Bay, and
38 Florida Bay) should be identified. Inflow volumes for the Existing Conditions Baseline, the
39 Initial Operating Regime, the Next-Added Increment Baseline, and the Next-Added
40 Increment Condition will be computed and displayed as described in section 4.6.1. For the
41 Initial Operating Regime computation, the portion of the Existing Conditions Baseline
42 required to meet restoration targets and the portion of the Initial Operating Regime required
43 to meet restoration targets should be used. The portion required for restoration targets will be
44 quantified by using salinity envelopes or other appropriate estuarine targets.

1 From analysis of the inflows, volume-probability curves and difference curves that are
2 generated, a summary table can be prepared displaying the locations as rows and the
3 differences between the IOR and Existing Conditions Baseline and the differences between
4 the Next-Added Increment Baseline and the Next-Added Increment Condition as columns for
5 the 10% exceedence probability, 50% exceedence probability, and 90% exceedence
6 probability. Example tables are shown in Figures 4-6 and 4-7.

4.7 IDENTIFYING WATER TO BE RESERVED OR ALLOCATED FOR THE NATURAL SYSTEM

The water to be reserved or allocated for the natural system will be identified using the appropriate difference between the volume-probability curve for the Initial Operating Regime and the Existing Conditions Baseline for both the Everglades (using the methodology of section 4.6.2.1) and the estuaries (using the methodology of section 4.6.2.2). Identification of water to be reserved or allocated for the natural system is to be based on quantifying surface water and groundwater inflow to each affected natural system basin listed below:

Everglades

- Water Conservation Area 1

- 1 • Water Conservation Area 2 (2A and 2B)
- 2 • Water Conservation Area 3 (3A and 3B)
- 3 • Big Cypress National Preserve
- 4 • Everglades National Park

5

6 Estuaries

- 7 • Caloosahatchee Estuary
- 8 • St Lucie Estuary
- 9 • Loxahatchee River
- 10 • Biscayne Bay
- 11 • Florida Bay

12

13 **4.8 ASSURANCE LANGUAGE FOR THE PIR**

14

15 The overarching objective of the Plan is the restoration, preservation, and protection of the

16 South Florida ecosystem while providing for other water-related needs of the region,

17 including water supply and flood protection. The Federal Government and the State of

18 Florida are committed to the protection of the appropriate quantity, quality, timing, and

19 distribution of water to achieve and maintain the benefits to the natural system described in

20 the Plan. Attachment 4-B summarizes State tools available to achieve and maintain the

21 benefits to the natural system.

22

23 The State will protect the water for the natural system by taking the following actions: 1) the

24 State will use its water reservation or allocation authority to protect the water made available

25 for the natural system from each project as required by section 601 of WRDA 2000; and 2)

26 the State has elected to protect the existing water in the natural system that the Project

27 Implementation Report identifies is necessary to achieve the restoration benefits of the

28 project, using resource protection authority under Florida law. Language setting forth these

29 commitments will be included in the Plan Implementation section of each PIR in the sub-

30 section entitled “Identification of Water Made Available” (See Guidance Memorandum #1,

31 Attachment 1-C “PIR Outline”). Model language memorializing this concept is contained in

32 Attachment 4-C.

33

34 **4.9 FUTURE CHANGES TO WATER TO BE RESERVED OR**

35 **ALLOCATED**

36

37 Implementation of the Plan will take place over a number of years; however section 601 of

38 WRDA 2000 and the Programmatic Regulations require project-specific analyses that

39 include the identification of the water made available and the water to be reserved or

40 allocated for individual projects.

41

42 The difference between the Initial Operating Regime volume-probability curve and the

43 Existing Conditions Baseline volume-probability curve will be used to quantify the volume

44 of water that needs to be reserved or allocated when the project becomes operational. This is

45 necessary because physical and operational constraints may exist temporarily in the system

1 and prevent the attainment of all of project’s projected benefits immediately upon operation.
2 Once these constraints are removed, the quantity of water made available for the natural
3 system is expected to change. Subsequent PIRs will contain the information necessary for the
4 State to make updated reservations or allocations of water to show progress towards and
5 ultimately to achieve this quantification.
6

7 **4.10 DOCUMENTATION OF GUIDANCE MEMORANDUM #4** 8 **ANALYSES IN THE PIR** 9

10 The analyses conducted to identify the water made available and to identify the water to be
11 reserved or allocated for the natural system will be documented in the PIR.
12

13 A summary of the identification of water made available for both the natural system and for
14 other water-related needs should be included in the Plan Implementation section of the PIR in
15 the sub-section entitled “Identification of Water Made Available” (See Guidance
16 Memorandum #1, Attachment 1-C “PIR Outline”). More detailed information about the
17 analyses should be placed in Annex C - Analyses Required by Federal and State Law in the
18 section entitled “Identification of Water Made Available.”
19

20 A summary of the identification of water to be reserved or allocated for the natural system
21 should be included in the Plan Implementation section of the PIR in the sub-section entitled
22 “Identification of Water to be Reserved or Allocated for the Natural System.” More detailed
23 information about the analyses should be placed in Annex C - Analyses Required by Federal
24 and State Law in the section entitled “Identification of Water to be Reserved or Allocated for
25 the Natural System.”

**ATTACHMENT 4-A
CERP ASSURANCE OF PROJECT BENEFITS AGREEMENT
(PRESIDENT-GOVERNOR AGREEMENT)**

**COMPREHENSIVE EVERGLADES RESTORATION PLAN
ASSURANCE OF PROJECT BENEFITS AGREEMENT**

WHEREAS, the Everglades ecological system is unique in the world and one of the Nation's great treasures;

WHEREAS, the Central and Southern Florida Project as originally authorized in 1948 has had unintended consequences on the Everglades and the South Florida Ecosystem;

WHEREAS, the Water Resources Development Act of 1992 authorized a Comprehensive Review Study (Restudy) of the Central and Southern Florida Project;

WHEREAS, as required by the Water Resources Development Act of 1996, the Restudy was submitted to the Congress of the United States on July 1, 1999;

WHEREAS, the Restudy, renamed the Comprehensive Everglades Restoration Plan, was authorized by the Congress in the Water Resources Development Act of 2000;

WHEREAS, the Comprehensive Everglades Restoration Plan (the "Plan") will restore, preserve, and protect the more than 2.4 million acres of the Everglades and the South Florida Ecosystem;

WHEREAS, implementation of the Plan will require a collaborative effort among Federal and State partners, and the Seminole Tribe of Florida and the Miccosukee Tribe of Indians of Florida, acting under Federal and State law, to achieve the shared goal of restoration of the Everglades and the South Florida Ecosystem;

WHEREAS, as the ecosystem is restored, all interests seek a level of assurance that they will receive the anticipated benefits from the Plan;

WHEREAS, the Federal interest in restoration flows largely from the substantial Federal resources in the ecosystem, including Everglades National Park and other National Parks, National Wildlife Refuges, and National Marine Sanctuaries, which comprise a significant portion of the natural system;

WHEREAS, in recognition of this interest, the Congress established that the overarching objective of the Plan is the restoration, preservation, and protection of the South Florida Ecosystem, while providing for other water-related needs of the region, including water supply and flood protection;

6

WHEREAS, section 601(h)(2) of the Water Resources Development Act of 2000 (the "Act"), requires that the President of the United States and the Governor of Florida enter into a binding agreement that ensures that water from the Comprehensive Everglades Restoration Plan will be made available for the restoration of the natural system;

WHEREAS, section 601(h)(3) of the Act further requires that the Secretary of the Army, with the concurrence of the Governor and the Secretary of the Interior, and in consultation with the Seminole Tribe of Florida, the Miccosukee Tribe of Indians of Florida, the Administrator of the Environmental Protection Agency, the Secretary of Commerce, and other Federal, State, and local agencies, promulgate programmatic regulations to ensure that the goals and the purposes of the Plan are achieved;

WHEREAS, section 601(h)(4)(A)(iii) of the Act requires that a Project Implementation Report (PIR) identify the amount of water to be reserved or allocated for the natural system under State law;

WHEREAS, section 601(h)(4)(B)(ii) of the Act requires that the Secretary of the Army shall not execute a Project Cooperation Agreement until any reservation or allocation of water for the natural system identified in the PIR is executed under State law;

WHEREAS, the State of Florida has the authority to reserve water for the natural system pursuant to Chapter 373, Florida Statutes;

The signatories to this agreement hereby affirm that:

As required by the Water Resources Development Act of 2000, water made available by each project in the Comprehensive Everglades Restoration Plan will not be permitted for a consumptive use or otherwise made unavailable by the State of Florida until such time as sufficient reservations of water for the restoration of the natural system are made by regulation or other appropriate means pursuant to Chapter 373, Florida Statutes, and in accordance with the project implementation report for the project and consistent with the Comprehensive Everglades Restoration Plan.

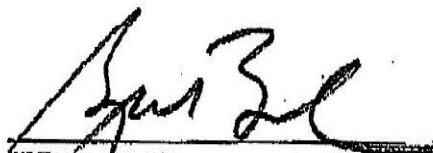

To effectuate this agreement, the Federal party agrees:

- To include within the President's budget submissions to the Congress requests for Federal appropriations in the amount the President deems necessary to implement the Federal share of the Plan's implementation;

- To initiate authorized project planning and design;
- To work with the State of Florida on developing information jointly to support the adaptive assessment component of the Plan;
- To use the planning process to supply information for both Federal and State legislative oversight requirements;

To effectuate this agreement, the State party agrees:

- To include within the Governor's budget submissions to the Legislature requests for State appropriations in the amount the Governor deems necessary to implement the State share of the Plan's implementation.
- To undertake reservations of water for the natural system upon completion of each PIR, and to ensure that reservations of water for the natural system will be consistent with information developed in the PIR, indicating appropriate timing, distribution, and flow requirements sufficient for the restoration of the natural system.
- To manage its water resource allocation process to ensure that water made available by each project in the Comprehensive Everglades Restoration Plan will not be permitted for a consumptive use or otherwise made unavailable for restoration of the natural system, consistent with the PIR and the provisions of the Water Resources Development Act of 2000.
- To monitor and assess the continuing effectiveness of reservations as long as the project is authorized, to achieve the goals and objectives of the Plan.

PRESIDENT OF
THE UNITED STATES

GOVERNOR OF THE
STATE OF FLORIDA

ATTACHMENT 4-B STATE TOOLS FOR PROVIDING ASSURANCES

5 State law includes provisions that were specifically enacted to implement the Plan by the
6 State as a partner with the Federal government. State law also contains provisions that will be
7 utilized to reserve and allocate water to the natural system and for other water-related needs,
8 sometimes referred to as “State water law.” These legal tools provided under State water
9 laws include water reservations, consumptive use permitting, water shortage management,
10 and minimum flows and levels.

11
12 State and Federal law specifically provide that State water law controls the procedures and
13 implementation of water reservations and allocation of water for natural systems and other
14 water-related needs and that nothing in the Federal law should be interpreted as prescribing
15 the process for implementing State water law. A description of the key provisions in State
16 water law are provided in the following paragraphs solely to provide background for the
17 guidance memoranda, as they will play a key role in assuring that the goals and purposes of
18 the Plan will be achieved.

20 STATE LAWS REGARDING CERP IMPLEMENTATION

21
22 The primary State authority regarding the implementation of the Plan is Chapter 373, F.S.
23 These provisions provide responsibility to the State, including the SFWMD and the Florida
24 Department of Environmental Protection (FDEP), to ensure restoration of the Everglades and
25 the protection of existing legal uses of water and existing levels of flood protection when
26 designing and implementing CERP project components.

27
28 Assurances are provided under State law requiring the Plan be used as a “guide and
29 framework...to ensure that the project components will be implemented to achieve the
30 purposes of the WRDA 1996 that include restoring, preserving and protecting the South
31 Florida ecosystem, ...and providing such features as are necessary to meet the other water-
32 related needs of the region, including flood control, the enhancement of water supplies, and
33 other objectives served by the project.” Section 373.470(3)(b)2, F.S.

34
35 To meet these assurances, State law provides specific provisions that apply to implementing,
36 funding, and permitting of CERP projects. These include sections 373.026(8), 373.1501,
37 373.1502, and 373.470, F.S. They are summarized in the following paragraphs.

38
39 Prior to any project component being submitted to Congress for authorization or receipt of an
40 appropriation of State funds for construction, the FDEP must approve each project
41 component, pursuant to section 373.026(8), F.S., upon a finding that the SFWMD has
42 complied with the requirements set forth in section 373.1501, F.S.

43
44 Section 373.1501(2), F.S., in part, provides that CERP components must be implemented
45 through appropriate processes under Chapter 373 and consistent with the balanced policies
46 and purposes of Chapter 373, F.S. Specifically, section 373.1501(5) provides assurances to

1 natural systems, existing legal users and for flood protection, including requirements that
2 SFWMD for each project component:

3
4 Section 5. Analyze and evaluate all needs to be met in a comprehensive
5 manner and consider all applicable water resource issues, including water
6 supply, water quality, flood protection, threatened and endangered species,
7 and other natural system and habitat needs.

- 8
9 i) Consistent with [Chapter 373], the purposes for the Restudy provided in
10 the WRDA of 1996, and other applicable Federal law, provide reasonable
11 assurances that the quantity of water available to existing legal users shall
12 not be diminished by implementation of project components so as to
13 adversely impact existing legal users, that existing levels of service for
14 flood protection will not be diminished outside the geographic area of the
15 project component, and that water management practices will continue to
16 adapt to meet the needs of the restored natural environment.

17
18 Prior to executing a PCA, the SFWMD must develop a PIR with the USACE to address the
19 requirements in section 373.1501, F.S., and to obtain approval under section 373.026, F.S.,
20 from the FDEP. This ensures that the PIR will be sufficient to meet both State, as well as
21 Federal, law requirements for implementing a CERP project.

22 23 **STATE LAWS FOR RESERVING, ALLOCATING, AND MANAGING** 24 **WATER RESOURCES**

25
26 As mentioned above, in addition to laws specifically enacted to implement the Plan, State
27 law also includes a framework of several tools for reserving, allocating and managing water
28 for the natural system and other water-related needs. These tools will play a key part in
29 providing assurances that the goals and purposes of the Plan will be achieved as required by
30 both State and Federal law. They are briefly summarized in the following paragraphs.

31 32 **Reservations of Water for the Natural System**

33
34 Section 373.470(3)(c), F.S., requires that each PIR identify the increase in water supplies
35 resulting from a project component. These increased water supplies for the natural system
36 must be allocated or reserved by the SFWMD under Chapter 373, F.S. section 373.470(3)(c),
37 F.S.

38
39 State law on water reservations, in section 373.223(4), F.S., provides:

40
41 “The governing board or the department, by regulation, may reserve from use
42 by permit applicants, water in such locations and quantities, and for such
43 seasons of the year, as in its judgment may be required for the protection of
44 fish and wildlife or the public health and safety. Such reservations shall be
45 subject to periodic review and revision in the light of changed conditions.

1 However, all presently existing legal uses of water shall be protected so long
2 as such use is not contrary to the public interest.”
3

4 When water is reserved under this statute, it is not available to be allocated for use under a
5 consumptive use permit and is protected for the natural system. The SFWMD anticipates that
6 both CERP and non-CERP related reservations will be adopted for Everglades protection.
7 For Plan reservations, the amount of water to be reserved is the water made available for the
8 protection of fish and wildlife by a Plan project.
9

10 Protection of fish and wildlife may include ensuring a healthy, sustainable population of fish
11 and wildlife that can remain healthy and viable through natural cycles of drought, flood, and
12 population variation, and can continue on into the future as a healthy, sustainable population.
13 Fish and wildlife to be protected are the native communities of fish and wildlife that use the
14 habitat in its healthy state, not exotic, invasive, or other species that have moved into an area
15 because the habitat has become degraded.
16

17 The CERP project reservation or allocation will identify water made available by the project,
18 which is in part based on project operations in concert with other existing CERP and non-
19 CERP projects and conditions. For this reason, the project reservation or allocation will be
20 appropriately conditioned to account for circumstances when such related projects and
21 conditions are not realized as anticipated. This may result in the need to revise the project
22 reservation or allocation based on unanticipated circumstances.
23

24 Pursuant to section 601 of WRDA 2000, CERP reservations or allocations for a specific
25 project must be executed prior to entering into the PCA for the project. However,
26 reservations or allocations are subject to periodic review based on changed conditions, such
27 as the changes that will occur in the C&SF Project as Plan projects become operational. This
28 provides flexibility to account for changes in implementation strategies, restoration
29 objectives, and contingency plans during the life of the project.
30

31 Presently existing legal uses of water are protected so long as they are “not contrary to the
32 public interest.” Under Florida law, permitted uses and domestic water uses (which are
33 exempt from requirements to obtain a permit) have the legal status of an “existing legal use.”
34 Unauthorized, including unpermitted, existing uses do not constitute an “existing legal use”
35 and are not protected by the statute.
36

37 **Consumptive Use Permitting** 38

39 In order to obtain a consumptive use permit, the permit applicant must provide reasonable
40 assurances that the use is “reasonable-beneficial”, will not interfere with any presently
41 existing legal use of water, and is consistent with the public interest, pursuant to section
42 373.223, F.S. The SFWMD implements this three-prong test pursuant to SFWMD rules,
43 including Chapters 40E-2 and 40E-20, Florida Administrative Code (F.A.C.). Permits are
44 conditioned to assure that uses are consistent with the overall objectives of Chapter 373, F.S.
45 and are not harmful to the water resources of the area.
46

1 Protection of water supplies for restoration of the Everglades natural system under CERP is
2 recognized as a legitimate and essential component of consumptive use permitting pursuant
3 to Chapter 373, Florida Statutes. Under the “public interest” test the SFWMD is authorized to
4 consider whether the project impacts fish and wildlife, among several other potential impacts
5 and benefits of authorizing a given consumptive use of water. These “public interest”
6 considerations are outlined in Chapter 373, F.S., including section 373.016, F.S., which
7 identifies the protection of fish and wildlife and development of water resources for meeting
8 existing and future reasonable-beneficial uses of water. Section 373.1501(2), F.S, specifically
9 requires that CERP implementation be consistent with the balanced policies and purposes of
10 section 373.016, F.S. section 373.1502(2)(a) provides that implementation of CERP is in the
11 public interest.
12

13 In exercising this authority allocation authority under Chapter 373, the SFWMD intends to
14 limit additional demands on the Everglades system from consumptive use withdrawals
15 through a restricted allocation rule covering Dade, Broward and Palm Beach county urban
16 service areas. This rule would have the similar effect as a water reservation for the
17 Everglades in that additional impacts on existing levels of water available in the Everglades
18 would not be permitted.
19

20 Permit durations under Florida law are tied to the time period for which the applicant can
21 provide reasonable assurances that the use will not be harmful to the water resources of the
22 area and are consistent with the overall objectives of the SFWMD. Under current district
23 rules, duration of permits for water from the Central and Southern Florida Project are limited
24 to allow renewal of existing levels of use for up to 20 years and to allow increased
25 allocations over existing levels of use for a five year interval.
26

27 In implementing this authority the SFWMD has agreed to include in its rules the following,
28 as appropriate:
29

- 30 1. Supplemental information identifying the expected water to be made available for the
31 natural system and for other water-related needs based on the system formulation
32 analysis to reflect the projected performance of the project through time up to the end
33 of the period of analysis (currently 2050) ensuring that the benefits of the Plan will be
34 achieved. The rule will include language that it will be updated in the future as
35 necessary to meet the actual changed conditions as quantified in future PIRs. The rule
36 will be reviewed and revised appropriately, at least every five years.
37
- 38 2. Include a limiting condition in consumptive use permits stating that upon renewal a
39 permit shall be modified as necessary to comply with consumptive use permit rules
40 that ensure such use is consistent with the CERP goals and purposes, including
41 adopted reservations and allocation rules.
42

43 **Minimum Flows and Levels**

44

45 Minimum flows are established to identify where further withdrawals would cause
46 significant harm to the water resources, or to the ecology of the area. Minimum levels are

1 established to identify where further withdrawals would cause significant harm to the water
2 resources of the area. Specific minimum flows and levels (MFLs) are established by rule for
3 specified priority water bodies that have been designated pursuant to section 373.042(2), F.S.
4

5 Minimum flows and level rules have been adopted for several areas within the C&SF Project,
6 including Everglades National Park and the Water Conservation Areas, which are contained
7 in Chapter 40E-8, F.A.C. The recovery strategy for meeting these MFLs includes
8 implementation of CERP and the SFWMD's Lower East Coast Regional Water Supply Plan
9 (2000), which includes Plan components. This recovery strategy will be updated through
10 SFWMD rulemaking and updates of the regional water supply plan. Under SFWMD MFL
11 rules for these areas consumptive use permit applicants must demonstrate that their use is
12 consistent with this recovery strategy. As such, MFLs are a key component in assuring that
13 the goals and purposes of CERP will be achieved.
14

15 **Water Shortage Implementation**

16
17 Pursuant to section 373.246, F.S., water shortage declarations are designed to prevent serious
18 harm from occurring to water resources during drought conditions, when shortfalls of water
19 occur. Declarations of water shortages by the SFWMD Governing Board are used to
20 equitably distribute the water resources for consumptive and non-consumptive uses during
21 droughts, including fish and wildlife, as provided in Chapter 40E-21, F.A.C. Water shortage
22 declarations are imposed in phases, with increasing water use cutbacks with increasing
23 drought conditions. CERP Project Operating Manuals include drought contingency plans,
24 which incorporate these water shortage rules for information purposes.
25

1 **ATTACHMENT 4-C**
2 **MODEL LANGUAGE FOR ASSURANCES SECTION OF THE PIR**
3
4

5 The overarching objective of the Plan is the restoration, preservation, and protection of the
6 South Florida ecosystem while providing for other water-related needs of the region,
7 including water supply and flood protection. The Federal Government and the State of
8 Florida are committed to the protection of the appropriate quantity, quality, timing, and
9 distribution of water to achieve and maintain the benefits to the natural system described in
10 the Plan. As envisioned in section 601 of WRDA 2000 and the Programmatic Regulations,
11 each Project Implementation Report will identify this appropriate quantity, quality, timing,
12 and distribution of water for the natural system.

13
14 The following language setting forth these commitments will be included in the “Project
15 Assurances Section” of each PIR (See Guidance Memorandum #1, Attachment 1-C “PIR
16 Outline”):

17
18 “The overarching objective of the Plan is the restoration, preservation, and
19 protection of the South Florida ecosystem while providing for other water-
20 related needs of the region, including water supply and flood protection. The
21 Federal Government and the non-Federal sponsor are committed to the
22 protection of the appropriate quantity, quality, timing, and distribution of
23 water to ensure the restoration, preservation, and protection of the natural
24 system as defined in section 601 of WRDA 2000, for so long as the project
25 remains authorized. This quantity, quality, timing, and distribution of water
26 shall meet applicable water quality standards and be consistent with the
27 natural system restoration goals and purposes of CERP, as the Plan is defined
28 in the Programmatic Regulations. The non-Federal sponsor will protect the
29 water for the natural system by taking the following actions to achieve the
30 overarching natural system objectives of the Plan:

31
32 1. Ensure, through appropriate and legally enforceable means under Florida
33 law, that the quantity, quality, timing, and distribution of existing water that
34 the Federal Government and the non-Federal sponsor have determined in this
35 Project Implementation Report is available to the natural system, will be
36 available at the time the Project Cooperation Agreement for the project is
37 executed and will remain available for so long as the Project remains
38 authorized.

39
40 2a. Prior to the execution of the Project Cooperation Agreement, reserve or
41 allocate for the natural system the necessary amount of water that will be
42 made available by the project that the Federal Government and the non-
43 Federal sponsor have determined in this Project Implementation Report.

44
45 2b. After the Project Cooperation Agreement is signed and the project
46 becomes operational, make such revisions under Florida law to this

1 reservation or allocation of water that the Federal Government and the non-
2 Federal sponsor determines, as a result of changed circumstances or new
3 information, is necessary for the natural system.

4
5 3. For so long as the Project remains authorized, notify and consult with the
6 Secretary of the Army should any revision in the reservation of water or other
7 legally enforceable means of protecting water be proposed by the non-Federal
8 sponsor, so that the Federal Government can assure itself that the changed
9 reservation or legally enforceable means of protecting water conform with the
10 non-Federal sponsor's commitments under paragraphs 1 and 2. Any change to
11 a reservation or allocation of water made available by the project shall require
12 an amendment to the Project Cooperation Agreement.”
13
14

1 subsections provide a brief summary of the composition of the SOM and the POMs, along
2 with the manual's relationship to existing USACE water control plans and Master Water
3 Control Manuals (Master WCMs).

4
5 Water control plans include coordinated operating schedules for project/system regulation
6 and such additional provisions as may be required to collect, analyze and disseminate basic
7 data, prepare detailed operating instructions, assure project safety and carry out regulation of
8 projects in an appropriate manner. Regulation schedule refers to a compilation of operating
9 criteria, guidelines, rule curves and specifications that govern basically the storage and
10 release functions of a reservoir. In general, schedules indicate limiting rates of reservoir
11 releases required during various seasons of the year to meet all functional objectives of the
12 particular project, acting separately or in combination with other projects in a system.
13 Schedules are usually expressed in the form of graphs and tabulations, supplemented by
14 concise specifications. Water control plans are developed for reservoirs, locks and dams,
15 deregulation and major control structures and interrelated systems to conform to objectives
16 and specific provisions of authorizing legislation and applicable USACE reports.

17 18 **5.3.1 Project Operating Manuals**

19
20 Each PIR developed under CERP will include a Draft POM as an annex to the PIR. As
21 described in section 5.5 of this Guidance Memorandum, the Draft POM in the PIR will be
22 updated and revised as necessary for subsequent phases of project implementation. Prior to
23 the completion of project construction, the assumptions in the Draft POM will be reviewed
24 and updated. The Draft POM will be revised as appropriate and promulgated as the
25 Preliminary POM for use during the Operational Testing and Monitoring Phase. A Final
26 POM will be completed for the long-term operations and maintenance phase of the project.
27 The preliminary and Final POMs for a project will be developed in compliance with NEPA
28 and in compliance with the Savings Clause of section 601 of WRDA 2000 (see Guidance
29 Memorandum #3).

30
31 One main purpose of the POM is for day-to-day use in water resource management for
32 essentially all foreseeable conditions affecting the project. The POM also documents how the
33 project objectives were translated into operational rules, thereby providing guidance when
34 unforeseen situations arise or conditions change. The POM should clearly describe what the
35 intent of the operational rules is. The POMs will include water management related
36 regulation schedules, detailed operating instructions and operating criteria developed to meet
37 the project purposes, goals, objectives and benefits outlined in the PIR, including the
38 quantity, timing and distribution of water for the natural system and other water-related
39 needs. The POMs may also contain provisions, as required, to collect, analyze and
40 disseminate basic data related to structure operations (e.g., headwater, tailwater, and stage).
41 The POMs will also include instructions to ensure project safety and to carry out project
42 operations in an appropriate manner.

43
44 The USACE and the non-Federal sponsor, in consultation with other Federal, State, tribal,
45 and local governments, will jointly develop and approve the POMs. Within the USACE,
46 approval authority for POMs rests with the USACE South Atlantic Division (SAD).

1 Development of POMs will be coordinated with SAD to ensure consistency with applicable
2 regulations. Development of the POMs will be carried out in a public process in accordance
3 with NEPA and other applicable laws and regulations. The POMs, along with other
4 information included in the PIR, will provide information necessary to complete an
5 application for water quality certification.

6 7 **5.3.2 System Operating Manual** 8

9 In general, the SOM will provide a system-wide plan for operation of the projects
10 implemented under CERP, as well as for other existing features of the C&SF Project. The
11 POMs are included in Volumes 2-7 of the SOM by providing the details necessary for
12 integrating the operation of the individual project components with the system-wide
13 operational framework described in Volume 1 of the SOM. The SOM will include the
14 operating criteria of all of the approved POMs.

15
16 The Programmatic Regulations require that the SOM initially be based on the existing
17 completed C&SF Project features and will be developed by the USACE and the SFWMD as
18 laws and regulations require. Existing water control plans, regulation schedules, and Master
19 Water Control Manuals (Master WCMs) for the C&SF Project will remain in effect until
20 approval of the SOM. The SOM will follow the procedures for preparation of water control
21 plans, regulation schedules and Master WCMs found in applicable USACE regulations. The
22 SOM is envisioned to be comprised of seven volumes. Volume 1 will provide a system-wide
23 operational framework for projects implemented under the Plan, as well as existing C&SF
24 Project features. Volumes 2 through 7 will be organized by geographical region and will
25 include an appendix containing each of the POMs for that region. The geographical volumes
26 of the SOM will be revisions of the original Master WCMs previously developed for the
27 C&SF Project. The entire SOM will be revised periodically to integrate changes and ensure
28 optimum system-wide operations.

29
30 The POMs will be considered supplements and revisions to the SOM, and will present
31 aspects of the projects that are not common to the system as a whole. As POMs for new
32 projects are implemented, the POMs will be inserted into an appendix of the appropriate
33 geographical volume of the SOM.

34
35 The USACE and the SFWMD, in consultation with other Federal, State, tribal, and local
36 governments, will jointly develop and approve the SOM. Within the USACE, approval
37 authority for the SOM rests with the USACE South Atlantic Division (SAD). Development
38 of the SOM will be coordinated with SAD to ensure consistency with applicable regulations.
39 Development of the SOM will be carried out in a public process in accordance with NEPA
40 and other applicable laws and regulations. The SOM will also meet the requirements of the
41 Savings Clause of section 601(h)(5) of WRDA 2000 and will contain documentation of the
42 Savings Clause analyses.

1 **5.4 GENERAL GUIDANCE FOR PREPARATION OF OPERATING**
2 **MANUALS**
3

4 This section provides general guidance related to development of operating manuals,
5 particularly with regard to: 1) coordination and public review during development of the
6 operating manuals; 2) ensuring consistency with other requirements of the Programmatic
7 Regulations; and 3) providing sufficient operational flexibility within the operating manuals
8 to accommodate the wide range of climatic and regional conditions that are frequently
9 encountered within the existing water management system. Attachment 5-A provides
10 detailed guidance related to the format and content for POMs and Attachment 5-B provides
11 detailed guidance related to the format and content for the SOM.
12

13 **5.4.1 Coordination and Public Review**
14

15 The following discussion is provided to emphasize the importance of enhanced coordination
16 between modelers, water managers, hydraulic designers and PDT members, as well as
17 providing guidance for public review and input, throughout the development of the PIR and
18 the POMs.
19

20 **5.4.1.1 Coordination Between Modelers, Water Managers, Hydraulic**
21 **Designers, and the Project Delivery Team**
22

23 The general procedure in the planning process is to develop alternative plans that are
24 intended to meet the project goals and objectives. These alternative plans are then evaluated
25 and compared against one another to select the best alternative. This evaluation and
26 comparison step often involves the use of hydrologic simulation models. One of the major
27 factors that can affect project performance during simulation modeling is the operating
28 criteria. In order for the planning process to result in practical and realistic project operations,
29 it is imperative that the operating criteria used for simulation modeling are feasible in the real
30 world, and that the simulation modeling adequately represents the project features and
31 operations. Thus, the POM must provide “real world” operating criteria that is consistent
32 with the assumptions from the original plan formulation and simulation modeling process.
33 The operating rules that are described in the Project Operating Manual must translate the
34 operational intent of the project necessary to achieve the benefits of the project. This can be
35 challenging since the formulation and evaluation of the project is based on simulation
36 modeling of an available period of record while the POM needs to describe the operating
37 criteria and protocols that are based on current conditions.
38

39 To maintain consistency throughout the operational planning process, continued coordination
40 and communication is required between the PDT, hydrologic simulation modelers, hydraulic
41 designers and water managers. During the early stages of operating criteria development, the
42 PDT should coordinate with modelers, designers, and water managers that are familiar with
43 current and past operations in the basin. Coordination between the PDT and the modelers
44 should be focused on ensuring that the modelers clearly understand the objectives of the
45 project features articulated in the PIR and how the operations of each feature are intended to
46 meet those objectives. With this information, the modelers will be able to conceptualize and

1 simulate the project features in a manner that is consistent with the objectives of the project
2 and the operating criteria. This is an extremely important consideration, as the modeling
3 process inevitably involves the use of simplifying assumptions. While these assumptions are
4 necessary, the modelers must be aware of the intent of project features, as well as how the
5 model output will be used to evaluate the performance of the project features.

6
7 Communication between the PDT and the water managers is also critical to ensure the
8 feasibility of implementing the POM in real-time, real world conditions. There are frequently
9 constraints on water levels and flow volumes within hydrologic basins that may affect the
10 ability of operations to be carried out within that basin. Water managers are a knowledgeable
11 resource for any real-world constraints that may apply to specific operations, and should be
12 consulted throughout the development of the operating criteria and the POM.

13
14 The project managers must ensure that the intent and objectives of the entire project are well
15 documented and that adequate communication regarding the intent of the operating criteria
16 takes place between the PDT, modelers, designers, and water managers during plan
17 formulation. In addition, documentation of how each project feature fits into meeting these
18 objectives is necessary. Effective communication between all parties involved in planning
19 and operating the project is the best assurance that project goals, objectives and desired
20 benefits will be achieved in the most efficient manner possible.

21 22 **5.4.1.2 Public Review Process**

23
24 The public will be provided with an opportunity to review and comment on the Draft POM as
25 part of the review process for the PIR as described in the Programmatic Regulations. Public
26 involvement activities will also be implemented to inform and educate the public about
27 updates and revisions to the POMs, and to allow opportunities for public review and
28 comment whenever significant changes are made to the POMs.

29 30 **5.4.2 Consistency with Requirements of the Programmatic Regulations**

31
32 It is essential that the project be operated to deliver water as identified in the PIR during each
33 phase of project implementation and operations described in section 5.5 of this Guidance
34 Memorandum. In addition, the Programmatic Regulations also specifically include several
35 provisions requiring consistency of the Operating Manuals with other factors, including: the
36 reservation or allocation of water made available by the State as required by section 601 of
37 WRDA 2000; Savings Clause provisions; changes made as a result of CERP updates; and
38 water quality standards and water quality permitting. The following provides a brief
39 discussion of these requirements.

40 41 **5.4.2.1 Consistency with Guidance Memorandum #4 and Consistency with** 42 **the Reservation or Allocation of Water made by the State Pursuant** 43 **to Section 601 of WRDA 2000**

44
45 In the PIR, the PDT is required to identify the water made available by the project and to
46 identify the water to be reserved or allocated for the natural system following the process

1 outlined in Guidance Memorandum #4. The Draft POM will be developed using the Initial
 2 Operating Regime, described in Guidance Memorandum #1 and in Guidance Memorandum
 3 #4, and will include conceptual discussion of the operations necessary for the Next-Added
 4 Increment Condition. The Draft POM will also include a discussion on how to transition
 5 from the Initial Operating Regime to the operations expected as constraints in the IOR are
 6 lifted. The operational rules expressed in the Draft POM must show how they will be used to
 7 achieve the benefits of the project and the Plan. Similarly, the Preliminary POM and the
 8 Final POM will also contain this discussion on how to transition from the Initial Operating
 9 Regime to the operations expected as constraints in the IOR are lifted.

10
 11 The Programmatic Regulations have a specific requirement that the POM must be consistent
 12 with the reservation or allocation of the water for the natural system that is made under State
 13 law (Guidance Memorandum #4).

14
 15 Both the consistency with the identification of water made available in Guidance
 16 Memorandum #4 and consistency with the reservation or allocation of water made available
 17 to the natural system will be accomplished through close coordination between the PDT,
 18 modelers, and water managers during all four of the following closely related tasks in the PIR
 19 development: 1) development of operating criteria for the hydrologic simulation modeling to
 20 optimize the benefits of the selected alternative plan; 2) development of the Initial Operating
 21 Regime 3) development of the POM; and 4) identification of water made available by the
 22 project and the identification of water to be reserved or allocated for the natural system.

23
 24 This coordination is graphically depicted in Figure 5-1. During the hydrologic simulation
 25 modeling of the selected alternative plan, the project operators and water managers will work
 26 with hydrologic modelers to develop operating criteria to be used in simulating operations of
 27 structural features of the selected alternative plan. The operating criteria from this model run
 28 will then be carried over and adapted for the preparation of the POM. The hydrologic
 29 modelers will work with project operators and water managers to ensure that the criteria and
 30 guidance in the Operating Manuals is a reasonable representation and captures the intent of
 31 the operating criteria used in the modeling and provides the intended benefits of the project.

34
 35
 36 **Figure 5-1: Relationship between Project Operating Manual and Other**
 37 **PIR Tasks**

1
2
3 **5.4.2.2 Savings Clause and State Assurances Provisions**
4

5 The Programmatic Regulations also require that the POM be consistent with the Savings
6 Clause requirements of WRDA-2000 to ensure that a new project resulting from
7 implementation of the Plan does not: 1) eliminate or transfer existing legal sources of water
8 until a new source of water supply of comparable quantity and quantity is available to replace
9 the water to be lost as a result of implementing the project; 2) reduce levels of service for
10 flood protection that are in existence on the date of enactment of WRDA-2000; or 3) have an
11 effect on the rights of the Seminole Tribe of Florida under the compact among the Seminole
12 Tribe of Florida, the State of Florida, and the SFWMD. This consistency will be maintained
13 by ensuring that the operating criteria in the POM are based on the criteria used for
14 hydrologic simulation modeling that was performed to verify conformance with Savings
15 Clause provisions during development of the PIR. As the POM is updated or revised,
16 analyses to determine if the project is causing an elimination or transfer of existing legal
17 sources of water or a reduction in levels of service for flood protection will be conducted to
18 ensure that project operations are in compliance with the provisions of the Savings Clause
19 (see Guidance Memorandum #3).
20

21 In addition to the Savings Clause provisions, the POM must be consistent with the assurances
22 provided in Chapter 373 of the Florida Statutes, for the project. These assurance are
23 described in Attachment 4-B to Guidance Memoranda #4.
24

25 **5.4.2.3 Consistency With Periodic CERP Updates**
26

27 In accordance with the Programmatic Regulations, the USACE and the SFWMD are required
28 to perform periodic CERP updates whenever necessary to ensure that the goals and purposes
29 of the Plan are achieved, but not any less often than every five years. The periodic updates
30 will provide one of the many means for determining if management actions are necessary to
31 seek improvements in CERP based on new information resulting from changed or unforeseen
32 circumstances, new scientific and technical information, new or updated modeling,
33 information developed through the adaptive management and assessment principles
34 contained in the Plan, and/or future authorized changes to the Plan. When necessary, changes
35 to the POMs and SOM will be considered to incorporate new information identified during
36 the CERP updates.
37

38 **5.4.2.4 Water Quality Standards And Water Quality Permitting Requirements**
39

40 In order to meet the requirements of section 601 of WRDA 2000 and the Florida Statutes, all
41 CERP POMs must be consistent with applicable water quality standards. Therefore, POMs
42 should provide sufficient information to demonstrate that proposed operations will be
43 consistent with applicable water quality standards and will meet the requirements set forth in
44 the State water quality certificate. Attachment 5-C provides some guidelines and examples
45 for information to include in the POM related to water quality certification.

1 **5.4.3 Relationship Between Operational Flexibility and Adaptive**
2 **Management**
3

4 Some level of operational flexibility must be incorporated into the POM in order to
5 accommodate the wide range of climatic and regional conditions that are frequently
6 encountered within the existing water management system. This operational flexibility is
7 necessary to allow water managers to better meet project goals, objectives and desired
8 benefits of the project while still providing for flood control and other C&SF Project
9 purposes. A simple example of operational flexibility is provided by spillways that could
10 have a high range and a low range of headwater stages that could be used depending on field
11 conditions. Another more extreme example of operational flexibility is illustrated by the
12 range of allowable discharges in the Decision Trees of the Lake Okeechobee Water Storage
13 and Environmental (WSE) regulation schedule adopted in 2000 (Attachment 5-D).

14
15 As discussed in Guidance Memorandum #6, adaptive management is an on-going refinement
16 process that is an integral part of the effort to provide continuous improvement of CERP.
17 Once the Final POM is implemented during the Long-term Operations and Maintenance
18 Phase of the project, monitoring and assessment of project performance, as well as the
19 system-wide performance of the Plan, may reveal opportunities or unforeseen problems
20 related to the project that may be outside the scope of the POM. These scenarios will be
21 addressed using the adaptive management protocols described in Guidance Memorandum #6.

22
23 The adaptive management process may result in modifications to water management
24 operations in the POM. If the operational modification recommended by the adaptive
25 management process falls within the established ranges of the POMs operational flexibility,
26 then the adaptive management recommendation may be implemented without revising the
27 POM. However, if the adaptive management recommendation falls outside the scope of the
28 POM, then additional analysis, formal agency coordination and public review, and/or a
29 temporary deviation approved as set forth in Attachment 5-A, section III, subsection 13,
30 “Deviation from Normal Operating Criteria” would likely be required to revise or deviate
31 from the operating criteria in the POM.

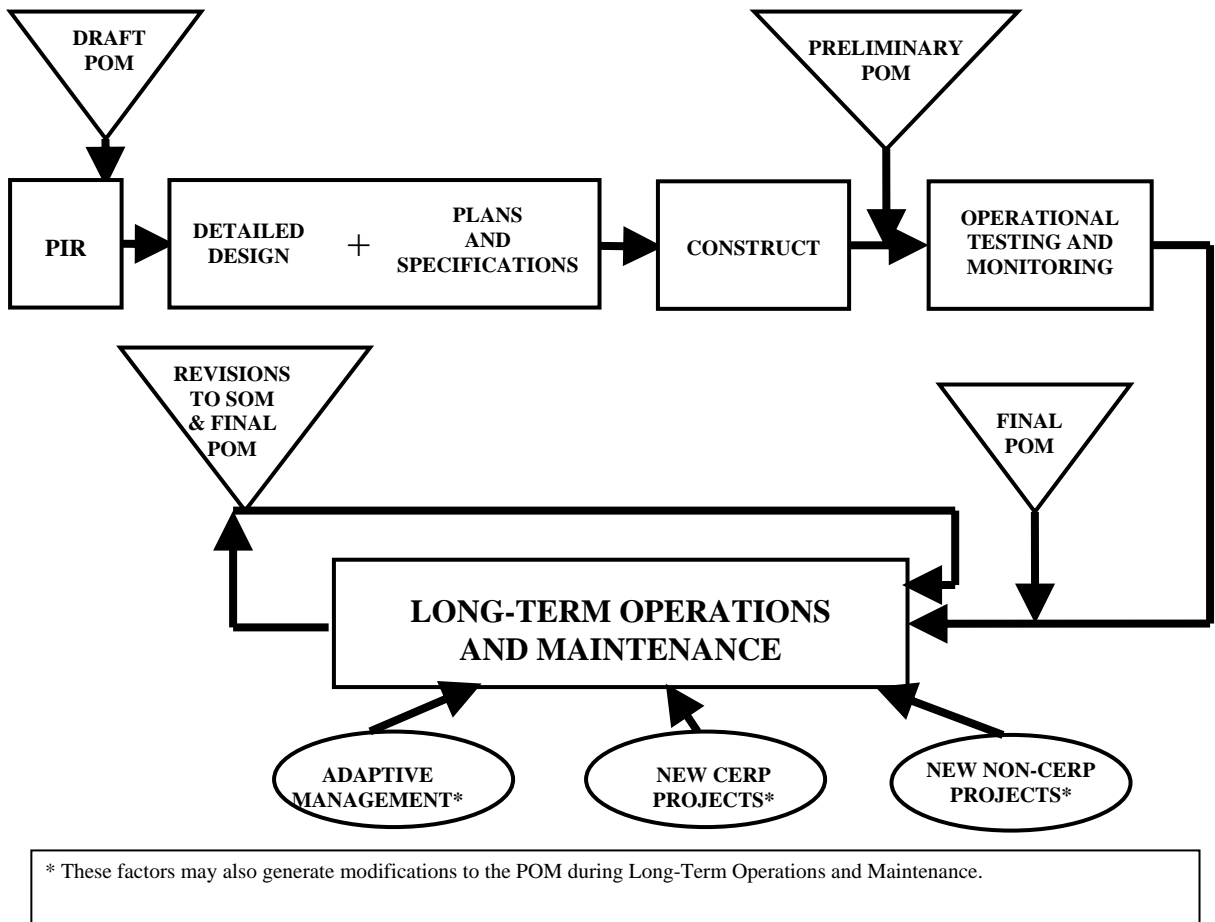

32
33 **5.5 PHASING OF PROJECT OPERATING MANUALS**
34

35 Development of POM will involve an iterative process that will continue throughout the life
36 of the project, as illustrated by Figure 5-2. The Draft POM will include operating criteria
37 based on the IOR and will generally discuss the transitions to operations during, construction,
38 the Operational Testing and Monitoring Phase, and the Long-term Operations and
39 Maintenance Phase. Refinements to the operating criteria will be made as more design
40 details, data, operational experience and information is gained during these phases. A
41 Preliminary POM will be prepared and approved for the Operational Testing and Monitoring
42 Phase. This will be followed by a Final POM that will be prepared and approved for the
43 Long-term Operations and Maintenance phase. After the Final POM is completed and the
44 Long-term Operations and Maintenance Phase is underway, the Final POM and the SOM
45 will continue to be revised based on additional scientific information, new CERP or non-
46 CERP activities being implemented, and new CERP updates.

1
2 As updates and revisions are made to the SOM, individual revised pages will be clearly
3 identified with the date of the latest revision. As a POM is revised, each previous iteration of
4 the manual will be archived to provide historical continuity for project operations.

5
6 As shown by Figure 5-2, the anticipated points of update and revisions to the POM are as
7 follows:

- 8 • Draft POM for the PIR/EIS
- 9 • Preliminary POM during Operational Testing and Monitoring Phase
- 10 • Final POM
- 11 • Revisions to the Final POM and SOM during the Long-Term Operations and
- 12 Maintenance Phase

15
16
17 **Figure 5-2 Phasing of the Project Operating Manual**

18
19
20 **5.5.1 Draft POM for Inclusion in the PIR**

1 Initially, a Draft POM will be developed during the PIR phase of the project. This Draft
2 POM will be consistent with, and part of, the NEPA documentation and will be included as
3 an annex to the PIR. Water management operations in the Draft POM will consider
4 operations of existing or planned projects with approved operating plans, including both
5 CERP and non-CERP activities, that may influence operations of the subject project. This
6 may include projects or project features that are upstream, downstream or in the vicinity of
7 the subject project, and operations to be used during construction. The Draft POM will
8 include operating criteria that are applicable for the construction phase and the Operational
9 Testing and Monitoring Phase. The operational rules expressed in the Draft POM must show
10 how they will be used to achieve the benefits of the project and the Plan. The Draft POM will
11 be based on the Initial Operating Regime (IOR).

12
13 The construction phase operations portion of the Draft POM will focus on facilitating
14 construction of the project components while maintaining established levels of project
15 purposes, such as water supply, flood protection, and any required delivery of water to the
16 natural system. Defining operating criteria to be used during construction will require
17 consideration of issues that are unique to the construction phase such as real estate issues,
18 construction schedules, contract sequencing, temporary by-pass canals, and dewatering
19 activities. During the design Phase, the Draft POM may need to be updated as a result of
20 updated information or changes to the project. Some of these POM modifications may result
21 from value engineering analyses conducted during the design phase. During the construction
22 phase, the Draft POM may need to be updated based on detailed design information and
23 operational experience gained during the construction phase.

24 25 **5.5.2 Preliminary POM**

26
27 The Preliminary POM will be used for operations during the Operational Testing and
28 Monitoring Phase (OTMP), which is the time period between completion of physical
29 construction and the final acceptance and transfer of the project or project feature to the non-
30 Federal sponsor and the assumption of operation and maintenance of the project or project
31 feature by the non-Federal sponsor. The purpose of the OTMP is to verify that the project
32 features perform as designed prior to transferring the project to the non-Federal sponsor. The
33 time period for the OTMP will be defined in the PCA. Analyses to determine if the project is
34 causing an elimination or transfer of existing legal sources of water or a reduction in levels of
35 service for flood protection will be conducted to ensure that OTMP operations are in
36 compliance with the provisions of the Savings Clause. When approved, the Preliminary POM
37 will be added to the appropriate volume of the SOM.

38 39 **5.5.3 Final POM**

40
41 Following completion of the OTMP, the Final POM will be prepared. The Final POM will
42 consolidate the incremental refinements recommended during the previous phases and will
43 describe water management regulation schedules and operating criteria for use by the non-
44 Federal sponsor for the long-term operation of the project component. Analyses to determine
45 if the project is causing an elimination or transfer of existing legal sources of water or a
46 reduction in levels of service for flood protection will be conducted to ensure that project

1 operations are in compliance with the provisions of the Savings Clause. This Final POM will
2 supersede all other iterations of the POM. At this point, the project or project feature will be
3 transferred to the non-Federal sponsor and operation and maintenance assumed by the non-
4 Federal sponsor. The Operation and Maintenance (O&M) Manual, a separate and distinct
5 requirement from the POM that establishes the policy for the long-term maintenance of flood
6 control and related structures, will also be completed at this time. The O&M Manual will
7 contain pertinent information for the safe and efficient use of the physical infrastructure of
8 the project, and maintenance of the project's structural, mechanical and electrical systems.

10 **5.5.4 Updating the Final POM**

11
12 After the Final POM is approved and long-term project operations are underway, it is likely
13 that the POM will need to be updated or modified over time. This may result from
14 implementation of new CERP project components, implementation of new non-CERP
15 activities, changes resulting from recommendations made through the adaptive management
16 and assessment process outlined in Guidance Memorandum #6 or changes made through
17 CERP updates. All revisions to the POMs and SOM will be completed in accordance with
18 the process outlined in the Programmatic Regulations and applicable USACE regulations,
19 consistent with applicable NEPA requirements. These regulations include ER 1110-2-240
20 Water Control Management (also published in 33 CFR 222.5); Engineering Manual (EM)
21 1110-2-3600 Management of Water Control Systems; ER 1110-2-8156, Preparation of Water
22 Control Manuals; and Engineering Technical Letter (ETL) 1110-2-335 Development of
23 Drought Contingency Plans.

24
25 It is anticipated that in some cases, a new CERP project and POM will result in a need to
26 change operating criteria and/or update a Final POM for an existing project. In that
27 circumstance, the NEPA requirements for the change to the existing POM may have been
28 fulfilled during the NEPA coordination for the new PIR. If not, then additional NEPA
29 documentation and public involvement may be required. Analyses to determine if the project
30 is causing an elimination or transfer of existing legal sources of water or a reduction in levels
31 of service for flood protection will be conducted to ensure that project operations are in
32 compliance with the provisions of the Savings Clause. The POM for the existing project will
33 be revised, as necessary, and will replace the old POM. This revised POM will also replace
34 the old version of the POM in the appropriate geographical volume of the SOM.
35 Furthermore, if the modifications to the existing POM will influence system-wide operations,
36 then Volume 1 of the SOM will be updated to reflect these changes, including the rationale
37 for the modifications and a description of any interactions between project features.

39 **5.6 DEVELOPMENT OF THE SYSTEM OPERATING MANUAL**

40
41 During the development of the original USACE Master WCMs for the C&SF Project (ER
42 1110-2-8156-Preparation of Water Control Manuals), the south Florida hydrologic system
43 was divided into five interconnected geographical regions. The SOM will replace this
44 existing set of Master WCMs. The SOM provides an integrated system-wide framework for
45 operating the implemented projects of CERP as well as the existing C&SF Project. The
46 complete SOM will provide explicit guidance and operating criteria for the operational

1 interactions between the system’s geographically related regions. Attachment 5-B provides
2 more detailed information on the format and content of the SOM.

3 4 **5.6.1 Composition of the System Operating Manual**

5
6 The SOM will consist of seven volumes, six of which (Volumes 2 through 7) are comprised
7 of the geographically related regions within the original C&SF Project. The overall system
8 framework of the SOM will be contained in Volume 1, which will provide a system-wide
9 operating plan for the implemented projects of the Plan and the C&SF Project features.
10 Generally, Volumes 2 through 7 will retain the original format of the Master WCMs for the
11 existing C&SF Project, with a few modifications to accommodate the CERP POMs. The
12 format of Volume 1 will be modified to provide the framework for system-wide operations.

13
14 The information from the existing C&SF Project Master WCMs will be utilized and modified
15 as necessary for the appropriate volumes of the SOM. A new volume, entitled “Southwest
16 Florida”, a region not covered in the original Master WCMs, will be added as Volume 7. The
17 C&SF Project “Authorities and Responsibilities (A&R) Manual” (the original Volume 1)
18 will be incorporated into the new Volume 1 of the SOM. The “Discretionary Changes”
19 chapter of the A&R Manual, which describes historical modifications to the C&SF Project,
20 will be moved to Appendix A of the new Volume 1 for reference purposes. The new volume
21 1 will include language that captures the system-wide intent of the CERP, the role of
22 RECOVER in evaluating the system-wide benefits and guidance on the periodic efforts to
23 conduct a system-wide analysis to ensure continuing optimum performance of existing
24 capability.

25
26 All approved water control plans, POMs, and/or operating criteria for C&SF Project
27 structures will be found in the appropriate geographical volume (Volumes 2 through 7) of the
28 SOM. Any modifications resulting from implementation of a new POM that are relevant to
29 system-wide operations will be incorporated into the appropriate SOM volume. The existing
30 C&SF Project structure descriptions and rating curves appendix, formerly found in Appendix
31 A of the Master WCMs, will be located in Appendix A of Volumes 2 through 7 of the SOM.
32 This appendix will be modified, and/or new descriptions added, as each new POM is
33 implemented.

34
35 Each CERP Preliminary and Final POM will be inserted into Appendix B of the appropriate
36 SOM volume as a supplement and will be referenced in the front of the SOM in a “History of
37 Revisions” table that will be updated as each POM is completed. The table will provide the
38 location of the POM within the SOM, the date the POM was completed, and the location of
39 the structure descriptions and rating curves.

40
41 To summarize, the SOM will consist of the following volumes:

- 42 • Volume 1: System Operating Manual–System-wide
- 43 • Volume 2: System Operating Manual–Kissimmee River–Lake Istokpoga Basin
- 44 • Volume 3: System Operating Manual–Lake Okeechobee and Everglades Agricultural
45 Area

- Volume 4: System Operating Manual–Water Conservation Areas, Everglades National Park, and ENP–South Dade Conveyance System
- Volume 5: System Operating Manual–East Coast Canals
- Volume 6: System Operating Manual–Upper St. Johns River Basin
- Volume 7: System Operating Manual–Southwest Florida

For clarification, Table 5-1 describes the old and new nomenclature for the 7 Volumes of the SOM.

Table 5-1: Old/New Nomenclature for the Seven Volumes of the SOM

VOLUME	OLD	NEW
1	Authorities and Responsibilities	System-wide
2	Kissimmee River–Lake Istokpoga Basin	Same
3	Lake Okeechobee and Everglades Agricultural Area	Same
4	Water Conservation Areas, Everglades National Park, and ENP-South Dade Conveyance System	Same
5	East Coast Canals	Same
6	Upper St. Johns River Basin	Same
7	None	Southwest Florida

5.6.2 Updates to the System Operating Manual

As discussed previously, each POM will be incorporated into the System Operating Manual. As the POMs are incorporated into the SOM, other sections of the SOM may need to be revised to ensure that the operations of all projects are integrated and consistent and that the system is operated to achieve the benefits of the Plan. The revision process must follow the requirements of the Programmatic Regulations.

This attachment provides guidance related to the format and content of POMs for CERP projects. In general, the POM should include descriptions and operating criteria for all structures that are part of the CERP project, such as gravity structures, pump stations, diversion, or ASR facilities. The POM should also consider and discuss foreseeable operations of other water resource projects that are hydrologically connected, but are not integrated components of the subject CERP project. The following provides more detailed instructions on format and content for the POMs.

I. Format of Project Operating Manuals

27
28
29

33
34
35
36
37
38
39
40
41
42
43
44
45

This section describes the general format for POMs. Some topic headings listed in this section may not be utilized in all phases of the POM. Topic headings may be included as placeholders in early Draft POMs for use in future iterations. Additionally, use of topic headings may vary depending upon the number and complexity of project features covered by the POM, as well as interactions with other C&SF Project features and other CERP features.

The “Table of Contents” in section II and the “Guidance on Content for Project Operating Manuals” in section III provide an easy to follow guide for preparation of POMs. These two sections should be used by the PDT as a checklist of relevant issues/items to be addressed in the Draft POM for the PIR.

A. General

The following items provide a summary of general formatting guidance for POMs:

- Manual covers will be color coded by basin.
- All completed versions of the POMs should have a spine labeled with the project name.
- Pages in the manuals should be dimensioned 8-1/2 by 11 inches and loosely bound with cover stock.
- Every page should include a page number and a date showing the most recent revision date.
- Individual revised pages will be clearly identified with the date of revision.

B. Editorial Guidance

The following guidance should be followed when developing the POM:

- Use of the term “regulation” should be used carefully because the term has multiple meanings. For example, “regulation” can mean either: (1) water control procedures and decisions that normally are determined by regulating engineers (hydrologic or hydraulic), or (2) legal rules, agreements, or contracts;

1 e.g., section 7 of Flood Control or Navigation Regulations, ER 1110-2-240, water
2 supply contracts, and ruling of interstate compacts.

- 3 • Use of the term “operation” should be restricted to physical manipulation of
4 spillway gates, outlet works, or instrumentation associated with projects.
- 5 • Use of the term “operator” refers to the individual who has the responsibility for
6 the physical “operation” of the project.
- 7 • Use of the term “water manager” refers to the individual who prepares the
8 successive phases of the POM, and participates in the development of the PIR and
9 the translation of modeling results to real-world operating criteria.

10 **C. Tables and Plates**

- 11 • Disperse tables that are one page or less in size throughout the text. Include all
12 tables that are over one page in the “Tables” section following the text to facilitate
13 narrative continuity within the text. Although these tables are located separately,
14 the table numbering system in the text should include both sets of tables—those in
15 the Tables section and those dispersed throughout the text. Page numbering for
16 the section on tables would be the same as numbering chapters except page
17 numbers would be preceded by a “T.” Reference to a table would read as
18 follows,” ... shown in Table 1-2 (see page T1-1)”, and in the List of Tables as:
19

20 Table	21 Page
22 1-1 _____	23 1-2
24 1-2 _____	25 T1-1
26 1-3 _____	27 1-4

- 28 • Include tables showing elevation versus area and elevation versus capacity in
29 increments of one foot or less. These tables should cover elevation ranges e.g.
30 from the bottom of the lake, storage area and impoundment to maximum pool.
- 31 • Plate and table numbers should correspond to chapter numbers where first
32 referenced. Example: Plate 1-1, 1-2, 1-3, 2-1, 2-2.
- 33 • Title block on plates should be easily readable when the manual is opened, with
34 the preferred location in the lower right-hand corner.
- 35 • Scales used on plates should be divided into units of one, two, five or multiples of
36 ten per inch. The scale selected should be easy to read and usable for actual
37 operations.

NOTE: The sections below that follow the main text of the document will be preceded by individual title pages:

- Tables
- Figures
- Plates/Operational Schematics
- Exhibits:
 - Structure Descriptions and Rating Curves
 - Formal Agreements
 - Water Control Data Acquisition System Plan
 - Standing Instructions to Project Operators
 - Other (e.g. supplementary pertinent data)

III. Guidance on Content for Project Operating Manuals

The content of the POMs may vary depending upon the number and complexity of project features covered by the POM, as well as interactions with other C&SF Project features and other CERP features. Most POMs will include the topic headings shown in section II Example Table of Contents. Paragraphs may be further subdivided when necessary. For example, subdivision may be necessary to accommodate larger projects, projects with multiple features, or projects that impact or affect adjacent projects that may also require some explanation. In addition, examples of site layouts and operational schematics can be found in Attachment 5-D.

The following provides guidance regarding the content for each of the paragraphs shown in Section II Example Table of Contents.

- i. Title Page**
- ii. Notice to Users of Manual**
- iii. Emergency Regulation Assistance Procedures**
- iv. Table of Contents**
- v. Pertinent Data.** The pertinent data included in this paragraph should be limited to approximately one page. If necessary, additional information relating to water

1 management may be tabulated in an exhibit following the main text of the document.
2 Restrict information included here as follows:

- 3 • Location (state, county, river/canal, and river/canal mile).
- 4 • Drainage area upstream of the project and the uncontrolled areas above any major
5 control points downstream.
- 6 • Site layout and schematic of project features. Examples of operational schematics
7 and figures are located in Attachment 5-D.
- 8 • Type, length, height, crest elevation, top width of dam, dikes, and tidal barriers;
9 type and size of all discharge facilities; spillway, pump stations, outlet works,
10 water supply pipes, and navigation locks.
- 11 • Real estate guide taking lines by fee and easement. (Optional for Draft POM.)
- 12 • Pertinent elevations with corresponding reservoir/storage area surface areas,
13 incremental and cumulative storage and discharge capacities of spillway and
14 outlet works for maximum pool, top induced surcharge, top flood control pool,
15 top conservation pool, top inactive pool, invert lowest intake, and streambed/canal
16 bottom. Also indicate the volumes of sediment reserve, dead storage, and the
17 range of any seasonal joint use, when applicable.

18 19 **1. Introduction**

20 This paragraph should include a very brief introduction to the POM which may
21 include, but is not limited to, the following:

- 22 • A statement that the main purpose of this POM is for day-to-day use in water
23 management for essentially all foreseeable conditions affecting the [INCLUDE
24 PROJECT OR PROJECT FEATURE NAME OR DESCRIPTION].
- 25 • A statement identifying project phase that this POM will cover (e.g., PIR/EIS
26 Phase, Construction Phase, and OTMP, or Long-Term Operations and
27 Maintenance Phase).
- 28 • A statement that there is a possibility that modifications and/or revisions to the
29 POM may occur during the remaining project phases.

30 31 **2. General Project Purposes, Goals, Objectives and Benefits**

32 This paragraph should include a summary of the project purposes, goals, objectives,
33 and benefits described in the PIR and should describe, in general terms, how the Draft
34 POM is designed to meet project purposes as stated in the PIR. This paragraph should
35 also include a statement that the project will be operated in accordance with the POM
36 to achieve the goals, purposes and benefits outlined in the PIR, including the quantity,
37 timing and distribution of water for the natural system and other water-related needs
38 identified through the process outlined in Guidance Memorandum #4.

39 40 **3. Project Features**

- 41 • Existing Features. Provide a brief description of existing project features by basin,
42 including water control structures, reservoirs, canals, stormwater treatment areas
43 (STAs), and a brief description of each feature's purpose and role in meeting the
44 project purposes and achieving project benefits.
- 45 • Proposed Features. Provide a brief description of the proposed features of the
46 selected alternative plan including location, water control structures, reservoirs,

1 canals, and STAs, with a brief description of each feature’s function in meeting
2 the project purposes and achieving project benefits.

- 3 • Removed Features. Describe any existing project features that will be or have
4 been removed or altered due to the new project, along with a brief explanation of
5 the reason that the operational function of this feature is no longer needed and/or
6 how this operational function will be provided by another project feature or
7 operational change, if applicable.

8 9 **4. Project Relationships**

10 As new CERP and non-CERP activities are implemented, POMs for existing C&SF
11 or CERP project features may need to be modified or revised. This paragraph should
12 describe how the new project features and/or operating criteria change, impact, link,
13 or interact with the existing features. If this new POM results in operational
14 modifications to other existing CERP or C&SF Project features, the POMs for the
15 existing project features will be revised and the revised POMs will supersede the
16 previous version of the POMs.

17 18 **5. Major Constraints**

19 Identify constraints related to the movement, storage, and/or utilization of the water
20 resource. List and explain constraints imposed by existing projects, anticipated
21 constraints from project components currently underway but not yet completed, and
22 anticipated constraints from future CERP projects. Describe physical constraints
23 including unremediated malfunctions; gate change limitations; structural and
24 hydraulic design limitations; discharge constraints associated with inoperative gates;
25 low pool level; ASR system intake and water supply; outlet limitations;
26 reservoir/storage area limitations associated with high pool levels such as backwater
27 into upstream structures, water quality concerns during initial filling and refilling of
28 storage/treatment areas, leaks in levees, embankment boils, and required movement
29 of facilities. This paragraph should also identify any potential legal, political, and
30 social conflicts with project operations, as well as any major conflicts between
31 purposes that could influence operations.

32 33 **6. Standing Instructions to Project Operators**

34 Briefly describe existing and proposed regulations for the project operators during
35 normal conditions, during communication outages, unforeseen emergency events
36 requiring deviations from prevailing regulation schedules, and spillway/outlet works
37 restrictions.

38 39 **7. Operational Strategy to Meet Project Objectives**

40 In general terms, briefly describe existing and proposed regulations and/or
41 operational strategies of project features to meet the goals, objectives, and benefits in
42 the PIR as described in Paragraph 2 (General Project Purposes, Goals, Objectives,
43 and Benefits), which include restoration, preservation, and protection of the South
44 Florida ecosystem, while providing for the other water-related needs of the region and
45 meeting the requirements for protection of health and public safety. Include project
46 component interaction with other project components from a system-wide

1 perspective. Briefly explain how the project component would be operated to meet
2 the quantity, timing, and distribution of water for the natural system and other water-
3 related needs identified through the process outlined in Guidance Memorandum #4.
4 Provide a brief explanation of the relationship of the Draft POM to the project's
5 phases as outlined in the PIR, the implementation schedules for projects currently
6 underway but not yet completed, and implementation schedules for future CERP
7 projects that may influence operations of the subject project component. Include a
8 summary of how the assumptions used in the development of the hydrologic
9 simulation model have been translated into operational rules to fulfill the project's
10 purposes, goals, objectives, and benefits.

11
12 a.) **Achieving Natural System Goals, Objectives, and Benefits.** State the primary
13 ecological objectives for the project features as outlined in the PIR, with a
14 description of operational criteria that are designed to meet those primary
15 ecological objectives. Operating criteria for the natural system must be designed
16 to achieve the environmental performance and benefits described in the Plan
17 while maintaining other water related needs. Operational criteria should be
18 consistent with water reservations or allocations and where applicable, should
19 include specific environmental operations such as marsh-driven, estuarine salinity
20 targets, or rain-driven operations, all of which are intended to avoid unintended
21 harmful impacts to the natural system. Operating criteria should include
22 descriptions concerning operational intent and explain how the operational rules
23 were developed to meet desired objectives. These objectives should seek to mimic
24 the natural hydrology of the receiving basin as much as possible. Included should
25 be a detailed description of the hydrologic targets, the predictive tools used to
26 estimate the targets, and discussions of operational flexibility. See Figure 5-D-9 in
27 Attachment 5-D for an example of predictive tools graphics. It should be noted in
28 the Project Operating Manual that the predictive tools graphics are planning tools
29 used to estimate the performance of the project and are based on the best available
30 science, hydrologic analyses and on historical meteorological conditions. Actual
31 meteorological conditions may vary from historical. Although operating criteria
32 for the natural system will be developed to achieve the predicted performance of
33 the project, these predictions may not be accurate in all cases. Project
34 performance will be monitored and adaptive management utilized to refine project
35 operations and performance as necessary to achieve expected benefits. Water
36 managers should be provided operational flexibility in meeting environmental
37 targets based on the water available and inherent system constraints. The Project
38 Operating Manual should contain a discussion of operational intent including this
39 operational flexibility.

40
41 b) **Flood Damage Reduction.**

42
43 i) **Normal and Emergency Operations.** Describe any flood damage reduction
44 operating criteria for project phases that require flood damage reduction
45 operations, including rule curves, triggers, water surface elevations, and
46 minimum flows. Include normal and emergency regulations. This discussion

1 should briefly address the following: an explanation of existing and proposed
2 operating criteria; release scheduling procedures during flood emergency;
3 computer applications; role of the USACE; relative emphasis upon controlling
4 peak outflow or pool level and backwater; use of seasonal or joint use storage;
5 regulation with respect to storage zones including surcharge; use of
6 streamflow predictions; forecasting total flow downstream; reference to
7 exhibits (Standard Design Flood [SDF], Standard Project Flood [SPF],
8 maximum flood of record, other); special concerns for safety. This paragraph
9 should also reference a release schedule or water management diagram (this
10 should be a table or plate, see EM 1110-2-3600). This paragraph should also
11 provide transitional operations, as necessary, for existing features that are
12 affected by new features coming on-line. Include a summary of how the
13 assumptions used in the development of the hydrologic simulation model have
14 been translated into operational rules relative to flood damage reduction, the
15 project area, and areas of concern adjacent to the project area.

16
17 **ii) Hurricane or Tropical Storm Operations.** State the agency/organization
18 that is responsible for operations at project water management structures prior
19 to, during, and after a hurricane or tropical storm. Provide a detailed
20 explanation of operating criteria to be followed before and during hurricanes
21 or tropical storms, if different from typical operating criteria. Include a
22 procedure for using weather forecasting and National Weather Service
23 broadcasts to determine the timing for implementation of hurricane or tropical
24 storm procedures. Reference the Emergency Action Plan for the project,
25 including the State procedure for interrupted communications, and the
26 procedure for informing local emergency management offices, if necessary.

27
28 **iii) Storage Area Weir Discharge.** Provide a general listing of conditions that
29 may cause reservoir/storage area emergency overflow weir discharge. Include
30 a detailed explanation of operating criteria to be followed at project features
31 when weir discharge is occurring due to exceedance of storage capacity at
32 reservoir/storage area.

33
34 **iv) Uncontrolled Discharge.** Provide a brief description and design capacity for
35 structures designed for uncontrolled discharge, including emergency overflow
36 spillways and uncontrolled weirs and culverts.

37
38 **c) Water Quality.** P.L. 92-500 requires that all Federal facilities be managed,
39 operated, and maintained to protect and enhance the quality of water and land
40 resources through conformance with applicable Federal, State, Interstate, and
41 local substantive standards. Where specific water quality benefits of a project
42 have been identified, this paragraph should include specific operating criteria that
43 are to be used to achieve those benefits. If no specific water quality benefits are
44 identified, this paragraph should include information on specific operating criteria
45 that are to be used continuously or periodically to ensure project compliance with
46 applicable Federal/State water quality standards. Appropriate staff, in conjunction
47 with water managers, should coordinate as necessary with FDEP and other

1 appropriate agencies to ensure that the project will comply with applicable water
2 quality standards or CERP water quality certifications and permits during all
3 phases of the project, including unique water quality concerns during the
4 construction phase.

- 5
- 6 d) **Water Supply Operations.** Describe operating criteria to be used to provide
7 releases to a canal or stream or withdrawal from a reservoir or storage area for
8 municipal/industrial/irrigation usage and/or resource protection; reference
9 contract(s), low flow requirements, fish and wildlife, water rights, roles of the
10 USACE and the non-Federal sponsor; short-term release scheduling; long-range
11 release planning, storage utilization (seasonal commingled, joint use). Show
12 storage accounting method for more than one use of conservation storage.
13 Reference and discuss example regulation exhibit. Include a summary of how the
14 assumptions used in the development of the hydrologic simulation model have
15 been translated into operational rules relative to water supply deliveries and
16 storage within the project area and beyond the project area.
- 17
- 18 e) **Recreation.** Identify any special release or operating criteria for recreational
19 activities such as fishing tournaments and competitive boating. Provide a list of
20 passive recreation that is anticipated to result from operation of project's reservoir
21 or storage area, if applicable. Project operations to enhance recreational activities
22 must be consistent with the purposes of the project.
- 23
- 24 f) **Fish and Wildlife.** Where applicable, describe any special operating criteria
25 necessary to accomplish specific fish and wildlife objectives that are in addition to
26 the natural system goals, objectives, and benefits of the project, such as fish
27 spawning, waterfowl, and endangered species.
- 28
- 29 g) **Navigation.** Release scheduling, accomplishment in general, lock filling and
30 emptying procedure, aids to navigation, reference and discuss example regulation
31 exhibit, integration with other projects.
- 32
- 33 h) **Other.** Where applicable, identify any special operating criteria necessary to
34 address other conditions and concerns such as: health and welfare, mosquito
35 control, aquatic plant management, debris control, low flow, freeze protection,
36 special or emergency drawdown, upstream/downstream/adjacent ground water
37 table, releases to aid construction upstream/downstream/adjacent, toxic and
38 hazardous material spills.
- 39
- 40 **8. Pre-Storm/Storm Operations**
- 41 This paragraph should outline the concept of pre-storm operations such as canal or
42 reservoir/storage area drawdown as it applies to project objectives. Provide an
43 explanation of operating criteria related to pre-storm and storm operations, including
44 rule curves, triggers, water surface elevations, and minimum flows to allow transfer
45 of canal water to reservoir/storage areas. Pre-storm operations should seek to avoid
46 negative impacts to the natural system and minimize negative impacts when they are

1 unavoidable. Provide discussion about how impacts to project purposes will be
2 considered in the decision to begin pre-storm drawdowns. This paragraph should
3 reference or describe procedures for using weather forecasting and National Weather
4 Service broadcasts, as necessary, to determine the timing for implementation of pre-
5 storm/storm operations. Include detailed operating criteria for pre-storm/storm
6 operations during the iterative phases of the project as necessary: Construction Phase,
7 OTMP, and Long-Term Operations Phase.
8

9 **9. Consistency with the Identification of Water and Reservations or Allocations**
10 **of Water for the Natural System**

11 In the PIR, the PDT is required to identify the appropriate quantity, timing, and
12 distribution of water for the natural system and other water-related needs in
13 accordance with the process outlined in Guidance Memorandum #4. This paragraph
14 should include a statement that the operating criteria within the POM are consistent
15 with the operating criteria used to identify the water made available for the natural
16 system during wet, average, and dry periods (reference the “Project Assurances”
17 section of the PIR). This paragraph should also specifically state that the operating
18 criteria are consistent with the water reservations or allocations for the natural system
19 made by the State in accordance with section 601 of WRDA 2000.
20

21 **10. Consistency with Savings Clause and State Assurances Provisions**

22 The operating criteria within the POM will be consistent with those used for
23 evaluating conformance with the Savings Clause during development of the PIR.
24 Describe any special operating criteria that are necessary to fulfill the Savings Clause
25 Provisions in accordance with the PIR. In addition, the operating criteria within the
26 POM will be consistent with those used for evaluating conformance with State
27 assurances provisions during development of the PIR
28

29 **11. Drought Contingency Plan**

30 Unless a project requires an individual DCP, the general regional DCPs located in
31 Volumes 2 through 7 of the SOM should be utilized. If a general regional DCP is
32 used, this paragraph should reference that specific regional DCP and volume of the
33 SOM.. In addition, the Rules of the SFWMD Water Shortage Plan will be located
34 with the DCP. This paragraph should include discussion on the relationship among
35 the DCP, MFLs, regulation schedule floors, and reservations or allocations of water
36 for the natural system and should include the process for how operations will be
37 determined during drought.
38

39 **12. Flood Emergency Action Plan**

40 Descriptions, completion dates, and physical location of plans (can be attached as an
41 exhibit in the POM or be a stand-alone document) if properly referenced in the POM.
42

43 **13. Deviation From Normal Operating Criteria**

44 This paragraph should describe approval and notification procedures required when
45 deviations from the POM are necessary. The USACE District Commander is
46 occasionally requested by the non-Federal sponsor to approve deviations from normal

1 operating criteria. Prior approval for a deviation is required from USACE-SAD
2 except as noted in subparagraph “a” below. Deviation requests usually fall into the
3 following categories:
4

- 5 a) **Emergencies.** Examples of emergencies that may result in a need to deviate from
6 normal operating criteria include: drowning and other accidents; failure of the
7 operation facilities; chemical spills; treatment plant failures; and other temporary
8 pollution problems. Water control actions necessary to abate the problem should
9 be implemented immediately unless such action would create equal or worse
10 conditions. SAD must be informed of the problem and the emergency operating
11 changes as soon as practicable. In addition, the non-Federal sponsor, the State of
12 Florida (FDEP and SFWMD), and the Department of the Interior should be
13 informed.
14
- 15 b) **Unplanned Minor Deviations.** There are unplanned instances that create a
16 temporary need for minor deviations from the normal operating criteria, although
17 these deviations are not considered emergencies. Construction accounts for the
18 major portion of these incidents requiring minor deviations. Examples of
19 activities that may require short-term deviations include construction of utility
20 stream/canal crossings and bridge work. Deviations are also sometimes necessary
21 to carry out maintenance and inspection of facilities. Requests for changes in
22 release rates generally involve time periods ranging from a few hours to a few
23 days. Each request should be analyzed on its own merits. In evaluating the
24 proposed deviation, consideration must be given to upstream watershed
25 conditions, potential flood threat, existing condition of the reservoir/storage area,
26 and alternative measures that can be taken. In the interest of maintaining good
27 public relations, requests for minor deviations are generally granted, providing
28 that these deviations will not have adverse effects on the ability of the project (or
29 projects) to achieve the authorized purposes. Approval for these minor deviations
30 normally will be obtained from SAD by telephone. Written confirmation
31 explaining the deviation and the cause will be furnished to the SAD water control
32 manager. In addition, the non-Federal sponsor, the State of Florida (FDEP and
33 SFWMD), and the Department of the Interior should be informed.
34
- 35 c) **Planned Deviations.** Each circumstance should be analyzed on its own merits.
36 Sufficient data on flood potential, lake and watershed conditions, possible
37 alternative measures, benefits to be expected, and probable effects on other
38 authorized and useful purposes, together with the USACE district
39 recommendation, will be presented by memorandum, facsimile, or electronic mail
40 to the USACE-SAD for review and approval. In addition, the non-Federal
41 sponsor, the State of Florida (FDEP and SFWMD), and the Department of the
42 Interior should be consulted as part of the process of receiving approval from
43 SAD for the deviation.
44

45 **14. Rate of Release Change**

1 This paragraph should provide the normal allowable rate of increase and decrease in
2 releases from the project features covered by the subject POM. The rate of release
3 change for the natural system should be designed to replicate the natural hydrologic
4 change in the receiving basin to the extent possible.
5

6 **15. Seepage Control**

7 Provide a detailed explanation of operating criteria to be used during operation of
8 project features for seepage control and marsh driven operations. Include conditions
9 when operation of features for seepage control is not beneficial, such as when a
10 reservoir or storage area is at design capacity, from beneficial seepage operations
11 such as returning seepage water to natural areas or seepage to recharge well-fields.
12 This discussion should include detailed operating criteria, as appropriate, for seepage
13 control and marsh driven operations during the iterative phases of the project:
14 Construction Phase, OTMP, and Long-Term Operations and Maintenance Phase.
15

16 **16. Initial Reservoir/Storage/Treatment Area Filling Plan**

17 Briefly describe the initial filling plan for projects involving reservoirs,
18 impoundments, natural storage and treatment areas, and/or stormwater treatment
19 areas (STAs). Include information on the preferred filling rate, the available options
20 to control the filling rate, the consequences of sole purpose operation to control the
21 rate, water quality requirements for the initial filling, and the most probable types of
22 problems that might develop during the initial filling. Reference any documents
23 prepared for the testing and/or initial use of project water management structures and
24 equipment. Describe the proposed hydrologic data collection and transmission system
25 and the plans for reading and evaluating instrument data and making visual
26 inspections of the dam and downstream areas, both related to increments of pool
27 level. Also describe which agency/organization will be responsible for decisions and
28 implementation of emergency plans as necessary. Outline guidelines on conditions
29 requiring notification of personnel in that organization and implementation of
30 emergency plans. The final version of this paragraph will be completed before the
31 OTMP of the project.
32

33 **17. Non-Typical Operations for Reservoir/Storage/Treatment Area Performance**

34 Describe any procedures and changes in operating criteria to be used for minimizing
35 or avoiding dryout during a drought. Describe anticipated operations during routine
36 maintenance or during situations where portions of the project are offline or out of
37 service. Identify storage/treatment area refilling plan to be used following drought or
38 offline operations. Refer to paragraph 16, Initial Reservoir/Storage/Treatment Area
39 Filling Plan, if the refill operations are similar.
40

41 **18. Aquifer Storage and Recovery System Plan**

42 This paragraph should provide a description of how the project's water management
43 structures will be integrated with ASR System capabilities. The paragraph should
44 provide a general description of the ASR System, including the objectives,
45 components, storage capacity, and pumping and discharge capabilities. The paragraph
46 should also include a detailed explanation of typical operating criteria, as well as
47 changes in operating criteria that may result from use of weather forecasts, for the

1 water management structures as the structures relate to management of water
2 provided by and utilized by the ASR System. This discussion may include operating
3 criteria for seasonal water storage to meet peak demands, long-term storage to meet
4 drought demands, emergency operations for potable water, and the operations for
5 water supply augmentation and flood damage reduction. This paragraph should also
6 include a general explanation of the ASR System operations as related to the project's
7 water management structures and reservoir/storage area capacity. Depending on the
8 project, implementation of the ASR System may be an iterative process.
9

10 **19. Water Control Data Acquisition System Plan (WCDASP)**

11 Provide a statement that the WCDASP may be started during the PIR phase, will
12 probably be completed during the Plans and Specifications Phase, and will be a subset
13 of the Water Control Data System (WCDS) that is specific to CERP. This paragraph
14 should provide a general description of the telemetry system, automation components,
15 or equipment related to the project's water management structures and which will
16 ultimately be needed to track relevant data after authorization of the Project. It should
17 also identify the agency/organization that is responsible for operation and
18 maintenance of the system or the system components. Include a description of the
19 relationship between the environmental monitoring plan and the WCDASP.
20 Equipment used in data acquisition essential to the water management function will
21 be included in the WCDASP. This includes all hardware and software to be used for
22 acquisition, transmission, processing, display, and dissemination of hydrological,
23 meteorological, water quality, and project data for the purpose of supporting the water
24 control mission. This may include, but is not limited to; uninterruptible power
25 supplies, field data collection platforms, and data communication devices and
26 circuits. The WCDASP will also identify site location of all hardware included within
27 the Plan. Hardware siting and gage reference datum will be determined through
28 coordination with appropriate agencies including the U.S. Geological Survey (USGS)
29 and the SFWMD. If this plan is over one page in length, the plan could be referenced
30 in this paragraph and included as an exhibit.
31

32 **20. Consistency with the Adaptive Management Program and Periodic CERP**
33 **Updates**

34 This paragraph should include a statement that after long-term operations and
35 maintenance of the project has been initiated, the POM may be further modified
36 based on operating criteria approved by the USACE and SFWMD resulting from
37 CERP updates and recommendations from the adaptive assessment process as
38 outlined in Guidance Memorandum #6.
39

40 **21. Interim Operations During Construction**

41 Interim operations utilized during the construction phase will be developed in
42 conjunction with the detailed construction schedule, if available. All interim
43 operations will be conducted to be consistent with the Assurances of Project benefits
44 as set forth in section 601 of WRDA 2000 and as discussed in the Programmatic
45 Regulations and the Guidance Memoranda. Some items that may be included in this
46 paragraph, the contents of which may change in the preliminary or Final POM, are (a)

1 Operational Strategy to Meet Project Objectives, (b) Project Relationships and
2 Interactions, and (c) Major Constraints. If the detailed construction schedule is not
3 available prior to completion of the PIR, this section can be inserted as a placeholder
4 to be developed once the construction schedule is known. For the preliminary and
5 Final POM, this section should be deleted since these operations would no longer be
6 needed.

7

8 **22. Preliminary Operations During Operational Testing and Monitoring Phase**

9 Preliminary operations for the OTMP will be developed in conjunction with the plan
10 for the Operational Testing and Monitoring Phase and promulgated in the Preliminary
11 POM. All preliminary operations will be conducted so as to meet the Assurances of
12 Project benefits as set forth in section 601 of WRDA 2000 and as discussed in the
13 Programmatic Regulations and the Guidance Memoranda. Some items that may be
14 included in this paragraph are (a) Operational Strategy to Meet Project Objectives, (b)
15 Project Relationships and Interactions, and (c) Major Constraints. The assumptions
16 and constraints may change in the Final POM.

17

18 **23. Conceptual Description of Project Operations for Transition from the Initial**
19 **Operating Regime to the Next- Added Increment**

20

21 The Draft POM is based on the Initial Operating Regime (IOR). A conceptual
22 discussion of how to transition from the IOR to the Next-Added Increment
23 Conditions will be provided in this section.

24

25 NOTE: The sections below that follow the main text of the document will be preceded by
26 individual title pages.

27

- 28 • **Tables**
- 29 • **Figures**
- 30 • **Plates/Operational Schematics**
- 31 • **Exhibits**. NOTE: Label the following items as exhibits instead of appendices,
32 reserving the latter term to tie individual POMs with their respective SOMs. The
33 number of exhibits will vary from project to project. “Standing Instructions to Project
34 Operators” should be the last exhibit.

35

- 36 ▪ **Structure Descriptions and Rating Curves.**
- 37 ▪ **Formal Agreements.** Examples are:
 - 38 -Memorandums of Understanding
 - 39 -Field Working Agreement
 - 40 -Section 7 Flood Control Regulations
 - 41 -Letters from other agencies or minutes of requesting commissions
42 acknowledging or concurring in important or unusual aspects of
43 the operating manual. To conserve space it may be desirable to
44 show only the portion of the contract pertinent to water
45 management, e.g., omit payment schedules.
- 46 ▪ **Water Control Data Acquisition System Plan**

1 **ATTACHMENT 5-B**
2 **FORMAT AND CONTENT OF THE SYSTEM OPERATING MANUAL**
3
4

5 **I. FORMAT OF THE SYSTEM OPERATING MANUAL**
6

7 Each volume of the SOM will contain nine chapters, outlined and briefly defined in Section
8 A of this attachment. However, the nine chapters of the System-wide, Volume 1, will be
9 modified somewhat to address the system-wide framework, and are listed separately. The
10 outline for Volumes 2 through 7 is modeled after page A-63 in ER 1110-2-8156, Preparation
11 of Water Control Manuals. Volumes 2 through 7 will generally follow the original format of
12 the Master WCMs for the existing C&SF Project, with a few exceptions to accommodate the
13 CERP POMs. When individual pages are revised within the SOM, the pages will be clearly
14 identified with the date of revision.

15
16 **A. Chapter Outline and Annotated Descriptions**
17

18 **System Operating Manual**
19 **Volume 1–System-wide**
20
21

- 22 **I.** Introduction–Discussion of purpose, scope, and operating agency.
23 **II.** Authorizations–Detailed discussion of project authorizations.
24 **III.** System-wide Watershed Description and Characteristics–Provide system-wide
25 description and characteristics.
26 **IV.** Description of System Components–Description of the major project subdivisions as
27 laid out in Volumes 2 through 7 of the SOM.
28 **V.** Data Collection and Communication Networks–Overview of data collection and
29 communication networks.
30 **VI.** System Hydrologic Forecasts–Description of system-wide forecasts.
31 **VII.** System-Wide Operating Plan–Discussion of the ability of the SOM to meet project
32 purposes. Focus on water management at the system-wide level.
33 **VIII.** Effect of System-Wide Operating Plan–Discussion of system-wide effects and benefits
34 from the SOM.
35 **IX.** Water Management Organization–Discussion of responsibilities, organization, and
36 interagency coordination.
37

1 **ATTACHMENT 5-C**
2 **GUIDELINES AND EXAMPLES FOR OPERATING MANUAL**
3 **CONTENT FOR WATER QUALITY CERTIFICATION ASSURANCES**
4
5

6 This attachment provides general guidance on information necessary to provide reasonable
7 assurances for water quality permitting. POMs should provide sufficient information to
8 demonstrate that proposed operations would be consistent with applicable State water quality
9 standards and requirements. The Draft POM will be included in the WQC application
10 provided to the FDEP. Along with the other application materials, the Draft POM will be
11 evaluated to determine whether the project can be constructed, operated, and maintained in
12 compliance with applicable water quality standards and applicable WQC requirements.
13

14 This attachment provides examples of the type of information that should be furnished for
15 most projects and some specific examples from existing operating criteria documents. It is
16 recognized that these projects vary widely and therefore project-specific issues/concerns may
17 need to be addressed. As a result, this guidance should not be interpreted as exhaustive or
18 limiting in scope. Additional information may be necessary on a project-specific basis. It is
19 also possible that the examples provided below may not be applicable to a given project and
20 therefore would not be included in the POM.
21

22 It should be noted that depending on the activity being authorized, the required content of the
23 POM may vary. In some cases, construction, operation, and maintenance authorization are
24 being sought, while in others only construction authorization or O&M authorization are
25 being sought. For instance, it should be noted that the USACE is not normally responsible for
26 structure operations, and therefore, under most circumstances, is not the applicant for the
27 operational authorization. However, USACE may be involved in functional testing of
28 structures during the Construction Phase and the OTMP in order to develop the Completed
29 Operating Manual. In this instance, the USACE would be seeking authorization of
30 construction activities and OTMP activities, while the non-Federal sponsor would seek a
31 separate authorization for long-term O&M of the project.
32

33 Ideally, construction, operation, and maintenance authorization will be sought concurrently,
34 with the goal being to obtain the water quality permit following completion of the PIR.
35 However, this is not always possible. If the permit application (including the Operating
36 Manual) contains enough information to provide FDEP with all necessary assurances, a
37 water quality permit may be issued at the completion of the PIR. Table 5-C-1 identifies the
38 phase of the POM and the general content that will be necessary to demonstrate reasonable
39 assurances for each activity:

1 **Table 5-C-1: General Content Needed to Demonstrate Reasonable**
 2 **Assurances for Activities in the Project Operating Manual**
 3

Activity	Phase of Operating Manual	Content
Construction	Draft POM	Interim Operations during Construction, Preliminary information on OTMP Operations
OTMP	Preliminary POM	OTMP Operations, including Modifications Resulting from Adaptive Assessment
Operations and Maintenance	Final POM	Final Operating Criteria, including Modifications to Draft POMs

4
 5 The following items and examples correspond to Sections II and III of Attachment 5-A.
 6

7 **Pertinent Data:**

8 Identification of design peak flow conditions and SPF

9 Examples:

- 10 • STA-1W: The Standard Project Storm ([SPS]; 120% of the 100 year/24-hour
 11 storm) rainfall depth is estimated as 23.6 inches for a 24-hour duration over a
 12 10-square mile basin area. During an SPS event, it is recommended to restrict
 13 inflow through structure G-302 to 1,110 cubic feet per second (cfs). For an SPS
 14 event, the estimated STA-1 inflow Basin maximum stage elevation was 19.4 ft.,
 15 NGVD.
- 16 • Cerrillos Dam and Reservoir: The SPF was routed using the following
 17 assumptions: (1) reservoir level at the beginning of the flood would be at the top
 18 of the conservation pool, elevation 537.0 ft, NGVD; (2) outlet works would be
 19 inoperative during the flood; and (3) that the spillway would consist of a 394-
 20 foot. wide uncontrolled emergency spillway with a crest elevation of 611.3 ft.,
 21 NGVD. The SPF routed maximum reservoir level is at elevation 627.6 ft.,
 22 NGVD. The design discharge for the spillway is 15,190 cfs so that this flow,
 23 combined with local inflows downstream, would not exceed the SPF capacity of
 24 the Ponce channels (21,739 cfs).

25
 26 **Introduction:**

27 Identification of developmental phase of POM

28 Examples:

- 29 • Draft POM for operations during construction
- 30 • Final phase of the POM

31
 32 **General Project Purposes, Benefits, Goals or Objectives:**

33 1. Identification of any water quality purposes of the project

34 Examples:

- 35 • Phosphorus reduction
- 36 • Reduction of freshwater pulse releases

1 2. General explanation of how the proposed operations meet the water quality purposes of
2 the project

3 Example:

- 4 • Preliminary Water Plan for the Ten Mile Creek Storage Area: Rapid pumping
5 to the reservoir and slow drainage from the reservoir mimics the behavior of
6 shallow surface storage that has been lost through development over the years.
7 When operated correctly, the reservoir reduces runoff from most storm events
8 and helps restore the historic flow patterns of freshwater entering the estuary.
9

10 **Project Features:**

11 1. Description of project features by basin including water control structures, reservoirs,
12 and STAs.

13 Example:

- 14 • Ten Mile Creek: Water will be put into the reservoir via S-382, a 380 cfs pump
15 station, located on the northern levee adjacent to the creek. S-382 will consist of
16 three pumps; one 60 cfs pump and two with 160 cfs pumping capacity. In
17 addition, the pump station will have a return bay with a 200 cfs capacity for
18 flows from the reservoir back to the creek.
19

20 2. Identification of downstream receiving waters and the “restoration objective water
21 body”, specify flow path

22 Example:

- 23 • Ten Mile Creek: The immediate downstream receiving water is C-96. The water
24 will then flow into Ten Mile Creek, downstream of the Gordy Road Structure.
25 Ten Mile Creek then flows into the North Fork of the St. Lucie River which
26 discharges into the Indian River Lagoon. Ten Mile Creek, St. Lucie River, and
27 Indian River Lagoon are all considered restoration objective water bodies.
28

29 3. Description of outflow discharge scenario, including, but not limited to, point or
30 sheetflow discharge

31 Example:

- 32 • Ten Mile Creek: The outflow structure will consist of a gravity control
33 structure, which will be a point discharge into the North St. Lucie River Water
34 Control District’s Canal 96. From this point, the water will flow north in Canal
35 96 and discharge downstream of the existing “Gordy Road” control structure on
36 the eastern end of Ten Mile Creek.
37

38 4. As appropriate, brief description of feature’s water quality design goal-such as STAs
39 (state target constituent level) and polishing cells (statement of no target level)

40 Example:

- 41 • Indian River Lagoon South Project: (Structure discharge to meet salinity
42 envelope in the estuary.) When the daily average salinity measured at the
43 Roosevelt Bridge in the St. Lucie Estuary is above 12 parts per thousand (ppt),
44 pump station S-421 will be triggered when there is over 1000 cfs flow at
45 spillway structure S-49, and 50% of the flow will be captured in the reservoir.
46 When the daily average salinity measured at the Roosevelt Bridge in the St.

1 Lucie Estuary is between 12-10 ppt, pump station S-421 will be triggered when
2 there is over 500 cfs flow at S-49, and 50% of the flow is captured up to 900 cfs
3 full capacity.
4

5 5. Identification of storage volume and treatment area available

6 Example:

- 7 • Ten Mile Creek: The reservoir and treatment cell will have a total storage
8 capacity of 6,000 acre-feet. The reservoir will have 526 acres of effective
9 storage area and the treatment cell will have 132 acres of treatment area.

10
11 **Project Relationships and Interactions:**

12 1. Description of any structural or operational changes necessary during construction.
13 Consideration of existing structures and structure operations, as well as temporary and
14 new features resulting from the project's ongoing construction phase

15 Examples:

- 16 • Kissimmee River Restoration Project: (Relocation of a structure.) Boat
17 launching ramps at S-65, S-65B and S-65C will be relocated to the edge of the
18 flood plain. Ramps will be connected with the restored river by access channels.
- 19 • Kissimmee River Restoration Project: U.S. Highway 98 will be temporarily
20 relocated to maintain traffic flow during construction of bridge openings. A
21 temporary 840-foot bypass extending 50 feet south of the existing road will be
22 constructed on existing spoil.

23
24 2. Consideration of interactions with operations and features of other projects existing,
25 under construction, planned, or scheduled, that are upstream, downstream, or in the
26 vicinity of the subject project

27 Example:

- 28 • STA-1West: Spillway 5AS (S-5AS) has historically been used to facilitate
29 water supply releases from WCA-1 to the L-10, L-12, L-8, and C-51 basin for
30 irrigation. Since the construction of the STA-1 Inflow Basin, operation of
31 S-5AS for water supply requires reverse flows through diversion structures
32 G-300 and G-301. This, in turn, necessitates the closing of inflow structure
33 G-302, preventing flows from entering STA-1W until irrigation demands are
34 met.

35
36 3. Operations to satisfy pump station warranty requirements

37 Example:

- 38 • STA-1West: Maintenance requirements for the G-310 discharge pump station
39 include operation of the pumps for approximately two to four hours per month
40 as necessary, to maintain mechanical integrity of the pumps.

41
42 **Operations to Meet Project Purposes:**

43 1. General description of movement and storage of water

44
45 2. Optimum flow and water elevations, may be season dependent

46 Examples:

- S-9A: Seepage from higher water levels in WCA-3A and WCA-3B flows eastward toward the Western C-11 drainage basin. The purpose of the project is to backpump seepage at S-9A into WCA-3A at the same rate that water enters the 7900 feet of C-11 Canal from the S-9A pumps to the S-381 gates. The S-381 structure acts as a canal divide to separate the urban area to the east of the structure from the mainly natural area located to the west.
- STA-1 West: Target stage/depths for both wet and dry seasons were established for the STA-1 West treatment cells. (These target depths for Cell 1 and 2, shown below in Table 5-C-2, are from Table 1, p.28, STA-1West Operation Plan.)

Table 5-C-2: Example Wet/Dry Season Target Stages from STA-1W Treatment Cells

Cell	Wet season/Target Stage (+/- .2 ft.)	Dry Season Conservation Stage/Depth when available (+/- .2ft.)	Measured at Structure	Operational Structure
1	11.9/1.8	12.4/2.3	G-253 HW	N/A
2	11.7/2.25	12.2/2.75	G254 HW	N/A

3. Maximum water elevations, may be season dependent

Example:

- STA-1 West: The maximum operational depth for treatment cells 1, 2, 3, and 4 has been established at 4.5 feet above average ground elevation.

4. Minimum water elevations, may be season dependent

Example:

- STA-1 West: To the extent practicable, operations of STA-1West will maintain stages at or above the 0.5 feet above the average ground elevation in the treatment cells to minimize potential negative effects of drought on subsequent project performance.

5. Pump station operational limitations

Example:

- Pump Station 6 (S-6): The present drawdown limit is elevation 9.0 ft., NGVD. Pumps may overheat if head is greater than (>) 7.0 feet. If, during a pumping operation, the water surface on the intake bay falls below elevation 9.0 ft National Geodetic Vertical Datum (NGVD) as indicated by the staff gauge, the speed of all pumps then operating should be reduced to not less than 500 revolutions per minute (rpm). If this does not restore the water surface in the intake pool to elevation 9.0 ft. NGVD, one or more of the pumping units should be shut down until the minimum pool elevation is re-established.

6. Statement of any operations or coordination procedures for water quality and any beneficial water quality aspects of each component

1 Examples:

- 2
- 3 • Algae Blooms in the Caloosahatchee River (C-43): During the seasonally dry
4 months from December to April of each year, the Caloosahatchee River flow
5 diminishes to the point that severe algae blooms may develop in the River above
6 the Franklin Lock and Dam. Municipal water intakes in this area could be
7 clogged with the algae. Short-term high rates of discharge from Lake
8 Okeechobee are required to break up the algae bloom.
 - 9 • Salinity Intrusion in the Caloosahatchee River (C-43): During the extreme dry
10 months of April and May, the river flow may drop to near zero. When this
11 condition prevails, navigation lockages through the W.P. Franklin Lock may
12 allow a saltwater wedge to move upstream. Eventually, the chloride content of
13 the water can exceed the drinking water standard of 250 parts per million (ppm).
14 When this occurs, SFWMD requests the USACE to flush out the saltwater with
15 a short-term high rate of discharge from Lake Okeechobee.

16 **Flood Damage Reduction:**

17 1. Description of areas of concern adjacent to project area

18 Example:

- 19
- 20 • STA-1 East: S-361 is a secondary inflow pump station that discharges directly
21 to Cell 4S. The intent is to provide drainage and flood control service to those
22 lands south and east of S-361 which were tributary to the C-51 West Canal, but
23 have been hydraulically severed as a result of the construction of STA-1 East.
24 Those lands consist of Rustic Ranches Subdivision, and agricultural lands west
25 of Flying Cow Road and south of Rustic Ranches. In addition, seepage
26 accumulated along the east line of STA-1East may be pumped into STA-1East
27 by S-361.

28 2. Sequencing of structure operations including operating criteria-can be presented in a
29 table, may be season dependent

30 3. Brief description of standard project flood used to design and operate project features

31 Example:

- 32
- 33 • STA-3/4: The Standard Project Storm ranges between 36.0 and 56.0 inches for a
34 three-day duration storm depending on site-specific conditions and risk
35 management considerations. STA-3/4 is considered low risk due to the long
36 distance from major urban population centers. Therefore, a maximum three-day
37 precipitation depth of 36 inches was employed in the design of STA-3/4 as
38 described in the Plan Formulation Document.

39 4. Identification of operations during high flow events (or address in uncontrolled
40 discharge section)

41 Example:

- 42
- 43 • S-80: During regulated maximum flood releases, the minimum headwater
44 elevation at St. Lucie Spillway (S-80) will be operated no lower than 10.0 ft.,
45 NGVD for lake stages up to 18.5 ft., NGVD. This is to help reduce erosion
46 upstream of the dam due to high velocities. However, past experience has

determined that an effort should be made to prevent the headwater at S-80 from receding below 12.0 ft., NGVD in order to avert problems with the nearby local irrigation pump intakes.

- STA-3/4: Summary of STA structure operations required during SPS event: maintain full pumping through Pump Stations G-370 and G-372; fully open all interior control structures; keep diversion structures G-371 and G-373 closed; operate seepage pumps within capacity to maintain 8.0 ft., NGVD within the seepage canal; and operate pump stations within capacity to maintain headwater stages of 14.0 ft., NGVD or lower.

Pre-Storm/Storm Operations:

1. Statement of project features operation initiation requirements

Example:

- Interim Operational Plan (IOP) for Protection of the Cape Sable Seaside Sparrow (IOP): Between 24 and 72 hours before tropical storm conditions in Miami-Dade, the following target water levels are set for the South Dade Conveyance System. The initiation of the pre-storm drawdown criteria will be triggered when Dade County falls within the average error forecast swath as developed by the National Hurricane Center (NHC). These pre-storm drawdown levels are not less than the level at which water supply deliveries are made during dry periods, that is 1.5 feet below optimum canal levels, except the reach north of G-211, which is 1.0 foot below current, normal operating levels.

2. Sequencing of structure operations including structure operating criteria-can be presented in a table, may be season dependent

Example:

- IOP: In an effort to achieve the specified drawdown targets, a sequence of operational actions is recommended as described in Table 5-C-3. The goal is to achieve one target before proceeding to the next sequence. However, since this goal may not always be possible to achieve the target level, operations will proceed based on the best available information at the time:

Table 5-C-3: Example Drawdown Targets for Various Reaches of L-31N and C-111

Sequence	Canal	Reach	Target Draw-Down Level (ft.)
1	L-31N	S-331 to S176	4.0
	C-111	S-176 to S-177	3.0
2	L-31N	G-211 to S-331	4.0*
	L-31N	S-335 to G-211	5.0

* If Angel’s well is 5.5 ft-NGVD or below, then 4.0 would be the target, otherwise, 3.5 ft-NGVD at the headwater of S-331 will be the target.

1 **Water Quality:**

2 1. State operations designed to achieve water quality objectives (including water quality
3 performance measures and minimum flow levels [MFLs]) or avoid water quality
4 constraints

5 Example:

- 6 • IRL: When the daily average salinity measured at the Roosevelt Bridge in the
7 St. Lucie Estuary is below 10 ppt, pump station S-421 will be triggered when
8 there is over 500 cfs flow at S-49, and all flow is captured up to 900 cfs
9 capacity.

10
11 2. Overview of coordination process to be used during the construction phase to ensure
12 compliance with water quality standards

13
14 3. Sequencing of structure operations including structure operating criteria-can be
15 presented in a table, may be season dependent

16 Examples:

- 17 • IRL: Proposed wet and dry season operations for the reservoir and STA are
18 shown in Table 5-C-4.

19
20
21 **Table 5-C-4: Example Wet and Dry Season Operations for IRL Reservoir and STA**

22

Reservoir Depth (feet)	Wet Season (June to November) Discharge to STA (cfs)	Dry Season (December to May) Discharge to STA (cfs)
1	10	5
2	25	5
3	40	10
4	60	20
5	80	30
6	100	40
7	100	50
8	100	100

- 23
24 • When S-401 is off, STA release from structures S-482 and S-498 shall be
25 adjusted according to the daily average salinity measured at the Roosevelt
26 Bridge in the St. Lucie Estuary, as shown in Table 5-C-5.

27
28 **Table 5-C-5: Example STA Releases at the Roosevelt Bridge**

29

Salinity (ppt)	STA Release (cfs)
>12	600
12-10	400
10-6	200
<6	0

1 **Water Supply:**

2 1. Sequencing of structure operations including structure operating criteria-can be
3 presented in a table, may be season dependent

4 Examples:

- 5 • IRL: During the dry season when there is a water supply demand in the
6 C-23 basin, water stored in the southern reservoir will be discharged back into
7 C-23 via drawdown structure S-413, at a maximum rate of 300 cfs.
- 8 • Site 1 Impoundment Project: Water supply releases are made from the Site 1
9 Impoundment via S-526A when the Hillsboro Canal upstream of G-56 recedes
10 to either 6.5-6.9 ft NGVD during the wet season or 7.8-8.2 ft., NGVD during
11 the dry season. Water supply releases from the impoundment will continue until
12 the Hillsboro Canal reaches either 7.3-7.7 ft., NGVD during the wet season or
13 8.3-8.7 ft., NGVD during the dry season, or until the Impoundment falls to
14 10.8-11.2 ft., NGVD, whichever occurs first.

15
16 **Recreation:**

17 If applicable, state any structure operating criteria-may be season dependent

18
19 **Fish and Wildlife:**

20 1. Sequencing of structure operations including structure operating criteria-can be
21 presented in a table, may be season dependent

22 Example:

- 23 • Manatee Gate Operations: Single or multiple gates at S-77: (1) to allow
24 manatees to pass under the gates, the minimum opening for any gate under the
25 “less than or equal to three feet of head” condition is two and a half feet; (2) if
26 during the adjustment process, the head across the structure should exceed three
27 feet, the gates should be closed in reverse order to openings permitted by the
28 maximum allowable gate opening (MAGO) curves, and the operating
29 procedures applicable to head greater than three feet should then be used.

30
31 **Navigation:**

32 If applicable, state any structure operating criteria-may be season dependent

33
34 **Initial Reservoir/Storage/Treatment Area Filling Plan:**

35 1. Identification of any water quality considerations during initial filling, pump tests, or
36 refill event

37 Example:

- 38 • STA-3/4: Since some of the vegetation will not be full grown by the time of
39 startup, certain precautions are required for storm and intra-event conditions.
40 Operational stage elevations will necessarily be required to be lower in cells that
41 have incomplete vegetation coverage. Once all vegetation coverage is complete,
42 as determined by the site manager, normal STA-3/4 operations can commence.

43
44 2. State operations that include preventing discharge from storage/treatment area to
45 avoid water quality constraints

46 Example:

- STA-3/4: In order to avoid the potential for initial discharges of higher concentrations of mercury following construction and initial filling (flooding) of the STA, samples will be collected to demonstrate that outflow concentrations of mercury are less than inflow concentrations, prior to initiating discharges.

Non-Typical Operations for Reservoir/Storage/Treatment Area Performance:

1. Drought Operations: Detail any procedures for minimizing or avoiding dryout (see DCP as appropriate)

Example:

- STA-1 East: The static water level within the treatment cells, to the greatest extent practicable, will be maintained to minimize potential negative effects of drought on subsequent project performance. All treatment cell interior structures will be operated to maintain the best distribution of available inflows. Outflow structures S-365, S-369, and S-372 will be closed to detain available water within the treatment cells. All treatment cell interior structures will remain open. Outflow pump station, S-362, will not discharge until desirable water levels and vegetative conditions within the treatment cells have improved, allowing for treatment cell discharge.

2. Treatment Cells Out of Service: Describe anticipated operations during routine maintenance or during situations where portions of the project are offline/out of service

Example:

- STA-1 West: Treatment cells and/or flow-ways may be isolated or “taken off-line”, when deemed necessary. Treatment Cells 5A and 5B can be taken off-line by closing structures G-304 A-J and G-306 A-J. Treatment Cells 1 through 4 can be taken off-line by closing G303. Treatment flow-ways 1/3 and 2/4 also have the capability of being taken off-line independently through manipulation of various inflow and outflow structures.

3. Storage/Treatment Area Refill: Identify storage/treatment area refilling plan to be used following drought or offline operations. If refill operations are similar to Initial Storage Area Filling Plan, refer to Item 17 in Section III of Attachment 5-A.

ASR System Plan:

- 1 General description of ASR system including objectives, components, storage capacity, and pumping and discharge capabilities
2. Description of relationship between existing water management structure operating criteria and operating criteria of the ASR system
3. State operations affecting interaction of project features and ASR

Example:

- Temperature equilibration

Exhibits:

1. Stage-duration curves
2. Discharge rating curves

Figure 5-D-7: Example of Structure Description and Operating Criteria Table

Structure 84

Location. S-84 is located on C-41A about 12 miles downstream from S-83 and about a mile upstream from the junction of C-41A with C-38, near Lake Okeechobee.

Purpose. The structure maintains optimum upstream water control stages in Canal 41A; it passes the design flood (30% of the Standard Project Flood) without exceeding the upstream flood design stage and restricts downstream flood stages and channel velocities to non-damaging levels; and it prevents backflow from Lake Okeechobee through C-38 during excessive stages in the lake resulting from floods or wind tides.

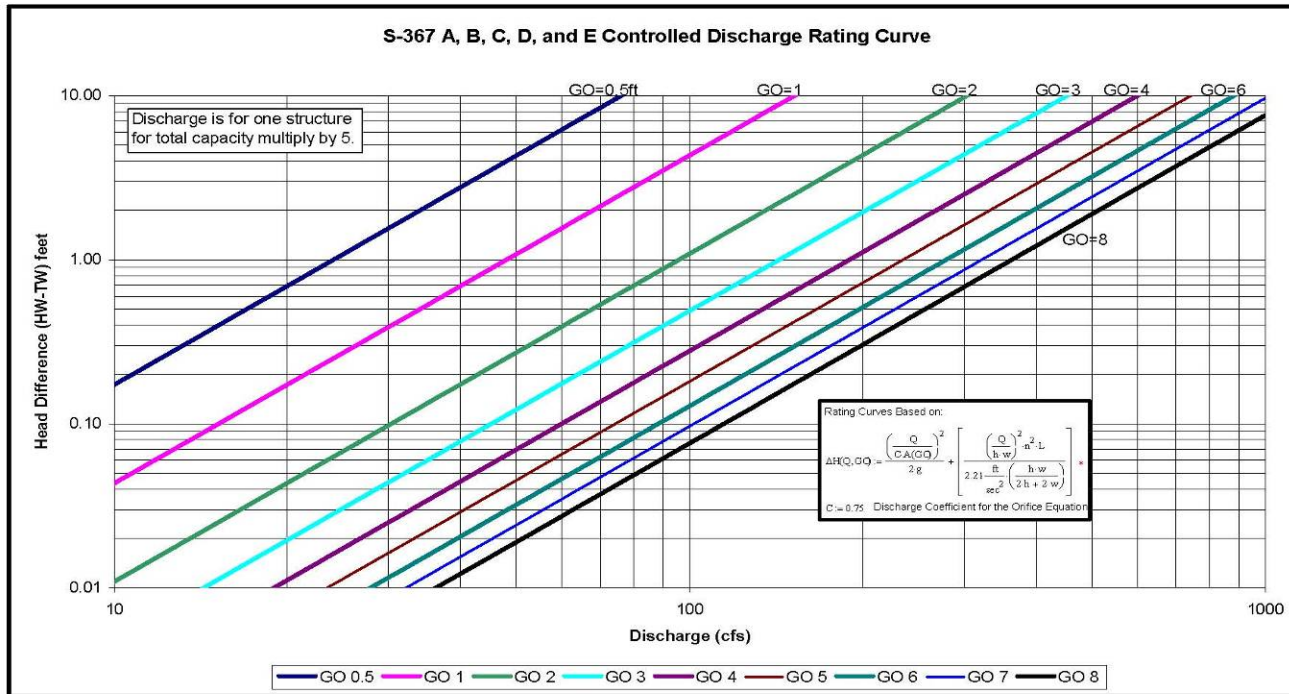

Description. The structure is a 2-bay spillway with vertical lift gates and a crest elevation of 13.2 ft., NGVD. The structure was designed to pass the 30-percent SPF (10-year) discharge of 5,670 cfs at a design headwater and tailwater of 24.5 and 19.3 ft., NGVD, respectively.

Operation. Normal headwater elevation is 25.0 ft., NGVD. Optimum water control is maintained between 24.3 and 25.2 ft., NGVD with automatic gate controls. The automatic controls restrict discharge to design flow by incremented gate openings for inflows greater than design flow. There should also be a description of how these operations contribute towards achieving benefits. Special operational rules for water delivery to natural areas should be included when appropriate.

For more information on this structure refer to the Kissimmee–Lake Istokpoga Water Control Manual.

1 **SECTION 6: GUIDANCE MEMORANDUM #6**
2 **ASSESSMENT ACTIVITIES FOR ADAPTIVE MANAGEMENT**

3
4
5 **6.1 PURPOSE**

6
7 This Guidance Memorandum provides general direction for the conduct of the adaptive
8 management program and the assessment activities of RECOVER. RECOVER is a system-
9 wide program of CERP that is responsible for the organization and application of scientific
10 and technical information to ensure that the system-wide goals and purposes of the Plan are
11 achieved. RECOVER is charged with implementing the Plan’s assessment activities
12 composed of four basic components: (1) development of a system-wide monitoring program
13 for the South Florida ecosystem; (2) design and implementation of data management and
14 analysis protocols; (3) interpretation of ecosystem responses to the Plan; and
15 (4) identification of opportunities for making changes to the Plan that would improve
16 performance and/or cost-effectiveness.

17
18 A critical element of the Plan’s adaptive management program is the development and
19 application of a scientifically rigorous assessment program to analyze and understand the
20 responses of the South Florida ecosystem to the implementation of the Plan. This Guidance
21 Memorandum describes the strategy for conducting credible scientific assessments of the
22 Everglades ecosystem to facilitate understanding of how the Plan is affecting the South
23 Florida ecosystem. Specifically, these assessments address hydrological, biological,
24 ecological, water quality, water supply, and other responses to the Plan. This Guidance
25 Memorandum does not provide complete guidance on how to conduct assessments.
26 RECOVER is developing a separate document “Assessing the Response of the Everglades
27 Ecosystem to Implementation of the Comprehensive Everglades Restoration Plan” that
28 provides more complete technical guidance for the conduct of assessments. This technical
29 guidance serves as the foundation for the development and subsequent revision of the
30 assessment portion of the Monitoring and Assessment Plan (MAP).

31
32 section 601 of WRDA 2000 establishes an integrated framework to ensure that the goals and
33 purposes of the Plan are achieved. Integral to this framework is the establishment of interim
34 goals and interim targets. The establishment of interim goals allows for assessment of
35 progress towards achieving the natural system restoration goals of the Plan and provides a
36 key feedback mechanism as ecosystem responses to implementation of the Plan are
37 monitored to ensure that the goals and purposes of the Plan are being achieved. Similarly,
38 establishment of interim targets allows for assessment of progress towards achieving other
39 water-related needs of the region.

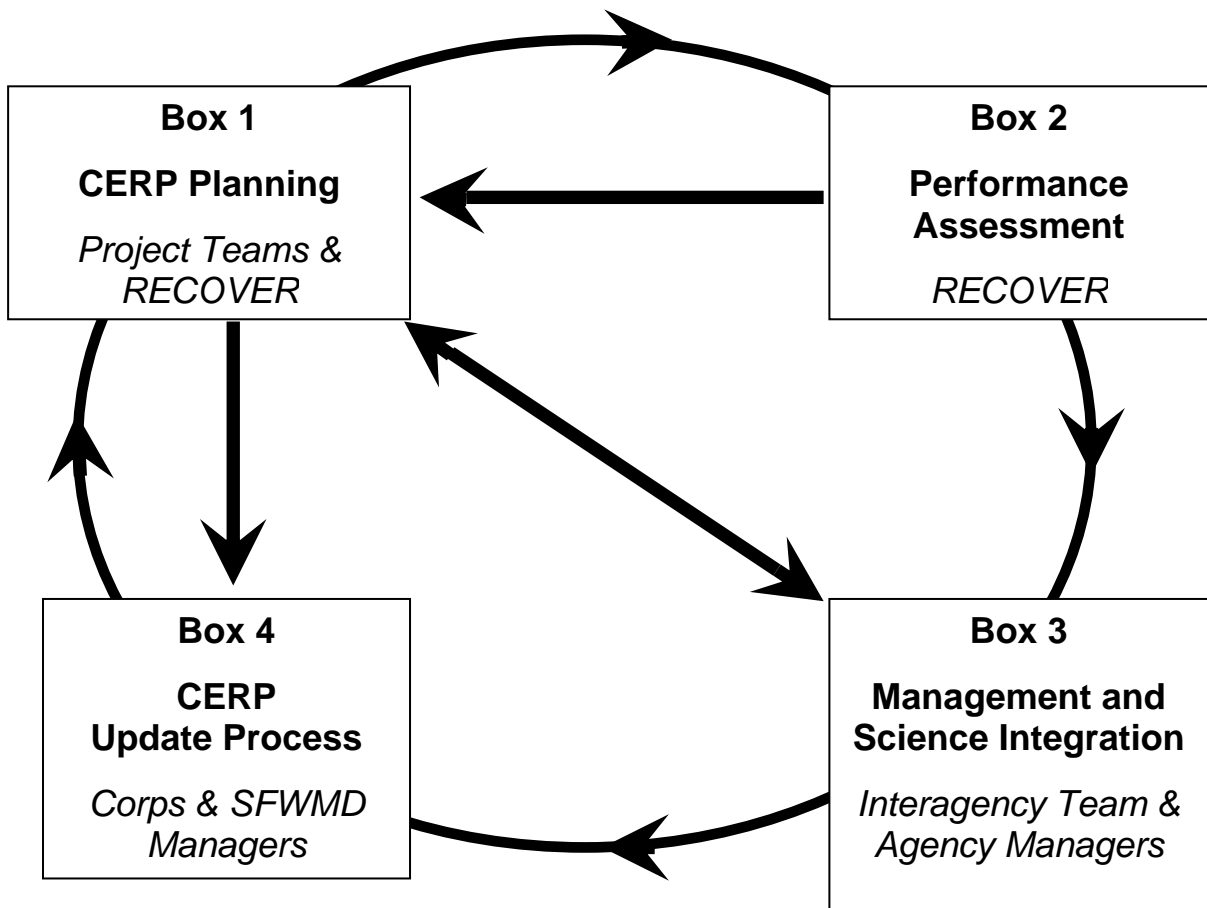

40
41 **6.2 APPLICABILITY**

42
43 This Guidance Memorandum applies to all individual projects of CERP as well as to the
44 integration of CERP projects into the comprehensive plan. This Guidance Memorandum also
45 provides specific direction to RECOVER, particularly the Assessment Team of RECOVER
46 responsible for assessment activities.

1
2 **6.3 ADAPTIVE MANAGEMENT**

3
4 **6.3.1 Introduction**

5
6 Development of an adaptive management program is a critical element of CERP. Adaptive
7 management for the Plan is defined in the Programmatic Regulations as “the continuous
8 process of seeking a better understanding of the natural system and human environment in
9 the South Florida ecosystem, and seeking continuous refinements in and improvements to the
10 Plan to respond to new information resulting from changed or unforeseen circumstances, new
11 scientific and technical information, new or updated modeling; information developed
12 through the assessment principles contained in the Plan; and future authorized changes to the
13 Plan in order to ensure that the goals and purposes of the Plan are fulfilled.” The adaptive
14 management program is intended to guide the implementation of the Plan and will be used to
15 assess the responses of the South Florida ecosystem to the Plan and to determine whether
16 these responses match expectations, including expected performance levels. Figure 6-1
17 outlines the adaptive management framework for implementing CERP.
18

19
20
21 **Figure 6-1: CERP Adaptive Management Framework Overview**
22
23

1 **6.3.1.1 Box 1: CERP Planning**

2
3 The principles of adaptive management should be applied during CERP planning activities at
4 both the system-wide and project-levels in order to anticipate and plan for performance
5 uncertainties and incorporate performance-based versatility into project designs and
6 recommended Plan improvements. There are several ways of addressing uncertainty: (1)
7 anticipate uncertainty and build performance-based versatility or robustness into the design
8 of the Plan and each individual project; or (2) detect and correct errors after project
9 construction and make adjustments as they arise to ensure restoration goals are achieved. The
10 former incorporates adaptive management principles into the planning process while the
11 latter option represents the traditional approach to planning activities.

12
13 The concept of **robustness** is important to the adaptive management strategy and can be
14 defined as the sensitivity of key design parameters to operate effectively given the variability
15 and uncertainty of future events. The use of robust alternatives addresses the dilemma of
16 making rational decisions today even though future conditions may be uncertain. Robustness
17 is the ability of the Plan or individual project components to accommodate surprise and to
18 perform well even under shifting conditions.

19
20 **System-wide Planning** - RECOVER will conduct periodic updates of CERP as required by
21 the Programmatic Regulations to ensure that the system-wide goals of the Plan are being
22 achieved. These updates are scheduled to occur at least every five years and will include
23 evaluation of the Plan using new and/or updated modeling, which utilizes the latest scientific,
24 technical, and planning information. The incorporation of an adaptive management approach
25 into the framework for restoration of the Everglades supports the improvement of system-
26 wide performance as learning and knowledge about the ecosystem improves. Broad planning
27 scenarios addressing new and/or updated modeling or information (e.g., sea-level rise or
28 updated modeling assumptions) are examples of new information to be evaluated at the
29 system-wide scale. Based on predicted Plan performance incorporating these scenarios, it
30 will be determined whether the Plan is still able to meet its goals and objectives. When
31 appropriate, results of these system-wide evaluations will be used to initiate management
32 actions within Box 3 (Management and Science Integration) that are necessary to adjust the
33 Plan.

34
35 **Project-Level Planning** - Each CERP project is developed by a PDT (PDT) responsible for
36 guiding the project through the planning process for CERP projects. Adaptive management
37 principles can be applied during development and formulation of alternatives and during the
38 detailed development of the selected alternative plan.

39
40 **6.3.1.2 Box 2: Performance Assessment**

41
42 An essential element of adaptive management is the development and execution of a
43 scientifically rigorous monitoring and assessment program to analyze and understand
44 responses of the system to implementation of the Plan. This assessment program relies
45 heavily on the implementation of the integrated system-wide monitoring plan for CERP,
46 entitled the Monitoring and Assessment Plan (MAP), but also would include new

1 information that is developed through improved models or scientific research. The scientific
2 and technical information generated from the implementation of the monitoring program and
3 from other sources will be organized to provide a process for RECOVER to assess CERP
4 performance and system responses and to produce system status reports describing and
5 interpreting the responses. Additionally, in accordance with the Programmatic Regulations,
6 RECOVER is required to prepare a technical report at least once every five years; this report
7 presents a system-wide assessment of whether the goals and purposes of the Plan are being
8 met, including whether the interim goals and interim targets are being achieved or are likely
9 to be achieved. Where appropriate, project-level data will also be incorporated into the
10 assessment of system performance.

11
12 **Monitoring and Assessing System Performance** - Implementation of the MAP allows
13 natural and human system responses to be assessed relative to stated hypotheses for these
14 ecosystems and evaluated relative to the trends or targets established for the Plan through
15 approved performance measures and targets. The MAP is a key component of the system-
16 wide adaptive management strategy and is essential for the success of CERP by supplying
17 the data necessary to assess system performance and modify the Plan to improve
18 performance, if necessary.

19
20 RECOVER will use a hypothesis-based approach for assessment of system performance,
21 which will provide a more robust and flexible approach than assessing individual
22 performance measures. The hypothesis-based approach uses the best available science and
23 models and recognizes the complexities of the ecological responses being detected by the
24 MAP and CERP project-level monitoring. The approach attempts to capture the mechanistic
25 interactions of multiple stressors rather than relying on a single metric to characterize
26 ecological complexity. Furthermore, the hypothesis-based approach is scientifically robust
27 and incorporates adaptive management principles such that it increases the likelihood of
28 detecting undesired and unexpected responses of the ecosystem to CERP implementation and
29 non-CERP activities.

30
31 **Interim Goals and Interim Targets** - Although the assessment performance measures
32 provide targets for pre-drainage restoration, the Programmatic Regulations require that the
33 incremental progress toward achieving CERP expectations be reported on a regular basis. To
34 fulfill this need and determine if CERP performance is progressing as expected, interim goals
35 and interim targets are being established to document the Plan's expected performance at
36 five-year increments throughout the implementation of the Plan. The technical reports
37 provided by RECOVER will help provide the means to determine if actual CERP
38 performance is reaching the level described in the interim goals and interim targets. The
39 utility of employing interim goals and interim targets lies in its ability to help detect whether
40 the Plan is performing as expected so that refinements can be made. Additionally, as
41 predictive capabilities improve and ecosystem relationships are better understood, the interim
42 goals and interim targets will be fine-tuned to more accurately reflect CERP expectations.
43 This incorporation of new information and subsequent refinement of the Plan to improve
44 performance embodies the ongoing responsiveness of the adaptive management process.

45

1 **RECOVER Technical Report** - The final product resulting from Box 2 is the RECOVER
2 Technical Report. The Programmatic Regulations state that “whenever it is deemed
3 necessary, but at least every five years, RECOVER shall prepare a technical report that
4 presents an assessment of whether the goals and purposes of the Plan are being achieved,
5 including whether the interim goals and interim targets are being achieved or are likely to be
6 achieved.” The Technical Report represents RECOVER’s system-wide science-based
7 assessment of CERP performance toward achieving the goals and purposes of the Plan and
8 will be used along with policy, legal, and cost considerations under Box 3 activities to
9 produce the Assessment Report.

10 11 **6.3.1.3 Box 3: Management and Science Integration by RECOVER and** 12 **Agency Managers**

13
14 Box 3 represents the phase of the adaptive management process in which scientists and
15 managers collaborate in understanding the challenges and opportunities presented by new
16 knowledge about, or unexpected events within, the south Florida ecosystem. Activities
17 encompassed within Box 3 are triggered by new knowledge that reveals a potential
18 opportunity to improve conditions in the South Florida ecosystem or a problem that could
19 require a change to CERP implementation. The products of Box 3 are issue identification and
20 an Assessment Report prepared by the USACE and SFWMD in accordance with section
21 385.31(b) of the Programmatic Regulations.

22
23 **Overview of Box 3 Actions** - The Box 3 process is comprised of two basic activities: issue
24 identification and Assessment Report. The objectives of issue identification are to recognize
25 whether implementation feedback is significant enough to trigger a Box 4 CERP update
26 process by the USACE and SFWMD. The issue identification is accomplished via a
27 structured dialogue involving scientists and managers. The goal of the dialogue is for
28 scientists and agency managers to develop a common interpretation of the scientific and
29 technical information which may have implications for management decisions affecting the
30 CERP program. The issue identification may involve a strategic search for useful ideas,
31 management measures, and more effective management approaches. The second activity is
32 Assessment Report. In accordance with the Programmatic Regulations, the Assessment
33 Report will be developed by the USACE and SFWMD, based on the Technical Report
34 prepared by RECOVER, as well as the information developed from the issue identification
35 accomplished through the structured dialogue among scientists and managers.

36 37 **6.3.1.4 Box 4: CERP Update Process**

38
39 The final element of the adaptive management framework involves the USACE and SFWMD
40 jointly deciding on a course of action based on the information provided by the issue
41 identification conducted under Box 3. Courses of action include investigating structural or
42 operational changes to the Plan or alterations to the sequencing of projects. The actions
43 encompassed within Box 4 will occur under the guidance of senior management within the
44 USACE and SFWMD in consultation with other agencies, tribal governments, and
45 stakeholders.. The selection of the preferred course of action by senior management from

1 USACE and SFWMD will be considered the course of action for improving performance that
2 best represents societal values, scientific input, and the policies of USACE and SFWMD.

3
4 **Modification of CERP** - If decision-makers determine that modification of the CERP is
5 required to improve Plan performance, in general there are three alternatives available to
6 decision-makers:

- 7 (1) Consider altering the sequencing of project implementation to adjust the
8 storage, treatment or delivery of water to improve interim performance;
- 9 (2) Consider operational changes to improve existing project performance, or
- 10 (3) Consider adjustments to the Plan. These changes could include adding,
11 deleting or modifying individual project components.

12
13 If the USACE and SFWMD determine that modifications to the Plan are necessary to achieve
14 the goals and objectives of the Plan, USACE and SFWMD will prepare a Comprehensive
15 Plan Modification Report using the formal process outlined in the Programmatic Regulations.
16 The report will contain appropriate NEPA documentation to supplement the Programmatic
17 Environmental Impact Statement included in the “Final Integrated Feasibility Report and
18 Programmatic Environmental Impact Statement” dated April 1, 1999. Minor adjustments to
19 the Plan, including operational changes, may be made through individual PIRs or changes to
20 the System Operating Manual and would include appropriate NEPA processes.

21
22 **No Modification to CERP** - If performance expectations are being met, then no changes to
23 the Plan would be required.

24 25 **6.3.2 Initiating Adaptive Management Activities**

26
27 There are a number of factors or events that will occur during the implementation of CERP
28 that may trigger the initiation of the adaptive management process. This section describes
29 these factors and events.

30 31 **6.3.2.1 Periodic CERP Updates**

32
33 The Programmatic Regulations require that the Plan be evaluated periodically using new or
34 updated modeling that includes the latest scientific, technical, and planning information. As
35 appropriate, the results of this evaluation may be used to initiate adaptive management
36 activities, as described in Boxes 2, 3, and 4 of Figure 6-1 including the consideration of a
37 Comprehensive Plan Modification Report, consistent with section 385.32 of the
38 Programmatic Regulations.

39 40 **6.3.2.2 Shortfalls in Project Performance**

41
42 In the event that a Plan project does not perform as planned and designed because there is a
43 “shortfall” in the quantity or quality of water that the project produces or if the restoration
44 benefits are not produced, the USACE and the SFWMD will initiate adaptive management
45 activities, including preparation of an assessment by RECOVER (Box 2) as described in this
46 Guidance Memorandum.

1
2 **6.3.2.3 Achievement of Interim Goals and Interim Targets**
3

4 The interim goals provide a means by which the restoration success of the Plan may be
5 evaluated at specific points throughout the overall planning and implementation process of
6 CERP and are established to facilitate inter-agency planning, monitoring, and assessment.
7 Similarly, the interim targets provide a means by which the Plan's progress towards
8 providing for other water-related needs of the region may be evaluated. If the USACE and
9 SFWMD find that the interim goals or interim targets are not met or are unlikely to be met,
10 then corrective actions would be initiated in accordance with the Programmatic Regulations,
11 including consideration of adaptive management actions.
12

13 **6.3.2.4 Required Periodic Assessments**
14

15 In accordance with the Programmatic Regulations, RECOVER is required to prepare a
16 technical report, not any less often than every five years, that presents an assessment of
17 whether the goals and purposes of the Plan are being achieved, including whether the interim
18 goals and interim targets are being achieved or are likely to be achieved.
19

20 **6.4 ASSESSMENT ACTIVITIES**
21

22 **6.4.1 Background Information**
23

24 The Programmatic Regulations provide authorization for, and requirement of, an adaptive
25 management program to continuously seek a better understanding of the natural system and
26 the human environment in the South Florida ecosystem and to provide a basis for making
27 refinements to the Plan. Adaptive management is a critical element of the Plan as a response
28 to new information to ensure that the goals and purposes of the Plan are fulfilled and that the
29 benefits to the natural system and the human environment are achieved. An essential element
30 of adaptive management is the development and conduct of a scientifically rigorous
31 assessment program to analyze and understand responses of the system to implementation of
32 the Plan. In the context of CERP, the overall adaptive management program includes four
33 basic components and steps (Figure 6-1). Collectively, these components and steps are
34 necessary to design and implement the system-wide MAP, to design and activate a data
35 management and data analyses protocol, to interpret and report system responses, and to
36 identify opportunities for making improvements to the Plan.
37

38 The module-level and system-wide assessments of natural and human system responses to
39 the CERP projects will provide the primary basis for conducting an adaptive management
40 strategy. Interpretations of system responses provided by these assessments will be used to
41 identify potential refinements and improvements in the design and operation of the Plan, in
42 the context of the overall adaptive management strategy.

1 **6.4.2 Applied Science Strategy in RECOVER**

2
3 RECOVER is responsible for the coordination and application of an Applied Science
4 Strategy (Ogden and Davis, 1999) during Plan implementation. This strategy outlines a
5 process for organizing current scientific understanding of wetland and estuarine ecosystems
6 into interrelated components that can effectively support restoration efforts. The major
7 components of the Applied Science Strategy are the development of regional and total
8 system conceptual ecological models, identification of performance measures and targets,
9 development and implementation of a system-wide monitoring program, and development of
10 an assessment strategy. Natural and human system responses will be assessed relative to
11 stated hypotheses for these systems and evaluated relative to the trends or targets established
12 for the Plan through performance measures and objectives outlined in the MAP.

13 14 **6.4.3 Conceptual Ecological Models**

15
16 Conceptual ecological models are the scientific foundation for a majority of performance
17 measures for the natural system used in the development of CERP (Ogden and Davis, 1999).
18 The conceptual ecological models illustrate the links among societal actions, environmental
19 stressors, and ecological responses (USEPA, 1998) and provide the basis for selection and
20 testing the set of causal hypotheses that best explain how the natural systems in South Florida
21 have been altered (Gentile et al., 2001). Developed as a planning and design tool, conceptual
22 ecological models are used in ecological risk assessment analysis worldwide (Rosen et al.,
23 1995; Gentile et al., 2001) and are one of the major components of the Applied Science
24 Strategy of RECOVER.

25
26 The conceptual ecological models, developed for 11 physiographic regions defined in the
27 MAP and a total system model (in preparation), provide the scientific basis for development
28 of the CERP system-wide monitoring design and assessment process. The conceptual
29 ecological models are a planning tool for translating the overall restoration goals of the Plan
30 into the specific performance measures that will be used to plan, design, and assess the
31 success of the Plan. In addition to illustrating the ecological links between the physical,
32 chemical and biological elements in specific physiographic regions of South Florida,
33 conceptual ecological models provide the scientific foundation for: (1) developing causal
34 hypotheses linking the most important hydrologic and chemical stressors with the major
35 ecological effects, thus forming the basis for predicting responses to CERP projects and other
36 restoration efforts, and (2) creating sets of measurable indicators of success (e.g.,
37 performance measures) as the basis for assessing how well the projects achieve the broad,
38 policy-level goals that have been established for CERP.

39 40 **6.4.4 Performance Measures**

41
42 Performance measures consist of ecological attributes or environmental stressors (e.g.,
43 hydrology, water quality, and habitat alteration) that are indicators of conditions in natural
44 and human systems. Performance measures, developed in large part from the conceptual
45 ecological models, have been integrated into hypotheses at a module scale (section 6.4.2.1),
46 which provide a framework for interpreting the system-wide performance of the Plan.

1 Additional performance measures are derived from Federal and State law or policy (e.g.,
2 water supply and flood protection). Indicators for the interim goals and interim targets will
3 also be incorporated into the system-wide performance assessment.
4

5 RECOVER has defined “assessment” and “evaluation” performance measures. Assessment
6 measures are those that can be directly measured during implementation of CERP projects in
7 order to track changes in the state of the natural and human systems. Evaluation measures are
8 used to predict system-wide performance as determined through simulation modeling of the
9 Plan. As understanding of the ecosystem increases, and model development continues, it is
10 expected that a more unified set of performance measures will be developed and used for
11 both evaluation and assessment. Performance measures include hydrology, water quality,
12 biological measures, water supply, and flood protection measures. Some performance
13 measures relate directly to the level of particular stressors (e.g., rate of nutrient input, degree
14 of alteration of salinity, depth of water), whereas others relate to key attributes of the
15 ecosystem (e.g., fish population size, oyster health, seagrass spatial extent). Achieving the
16 targets (or trajectories towards the targets) of a well-selected set of performance measures is
17 expected to result in system-wide sustainable restoration, as described in the Plan. To
18 optimize the assessment and adaptive management process, a single integrated set of
19 performance measures with both predictive (evaluation) and assessment elements should be
20 considered for RECOVER system-wide tasks including project alternative evaluation,
21 assessments, and the interim goals and interim targets. The application of an integrated set of
22 performance measures fosters clear assessment of targeted system responses and allows
23 project planning to be guided by the same indicators and endpoints as will be used to monitor
24 progress during the implementation of the Plan. Performance measures for CERP are
25 identified in the Plan’s System-Wide Performance Measure Documentation Report.
26

27 **6.4.5 MAP Module Groups** 28

29 The MAP modules represent four geographical regions of the South Florida landscape, with
30 additional modules for hydrology monitoring (to assist in evaluating water supply and flood
31 protection performance measures) and mercury bioaccumulation. These modules function as
32 the basic organizing elements and research units of the MAP and form the basis for the
33 scientific teams that interpret and analyze monitoring data. These modules include:

- 34 • Greater Everglades
- 35 • Southern Estuaries (Florida and Biscayne Bays, Southwest Florida Coast)
- 36 • Northern Estuaries (St. Lucie Estuary/Southern IRL, Caloosahatchee Estuary, Lake
37 Worth Lagoon, and Loxahatchee River Estuary)
- 38 • Lake Okeechobee
- 39 • South Florida Hydrology Monitoring (Water Supply and Flood Protection)
- 40 • South Florida Mercury Bioaccumulation

41
42 The four geographic modules encompass one or more of the conceptual ecological models
43 described above. Each module contains a sampling network designed by a module group,
44 with consideration of compatibility and efficiency that was derived from coordination with
45 the other modules.
46

1 Module Groups are teams of scientists and technical experts with expertise in ecology,
2 hydrology, and water quality, and who have experience relative to the natural or human
3 systems described in the MAP modules. Module Groups combine the senior scientists of the
4 agencies participating in the development and implementation of the MAP with other leading
5 scientists who are widely recognized in their fields and are actively working in South Florida
6 ecosystems.

7
8 The Module Groups and associated Principal Investigators are responsible for coordinating
9 the implementation and quality assurance of the MAP monitoring and research projects for
10 each of the modules. Module Groups ensure that implementation of specific monitoring
11 components follows the overall program sequencing developed by the Assessment Team of
12 RECOVER. Module Groups are also responsible for comparing the MAP monitoring data
13 requirements to the non-MAP data already being collected to identify where existing efforts
14 can be incorporated or modified to meet MAP monitoring and assessment guidance criteria.

15 **6.5 GUIDANCE FOR THE CONDUCT OF ASSESSMENT** 16 **ACTIVITIES OF RECOVER** 17

18
19 Assessment activities are organized into three major themes: (1) the efficacy of monitoring
20 components and research activities implemented as part of the system-wide monitoring
21 program, including review of reports from project-level monitoring; (2) the implementation
22 of the Plan in terms of regional and system-wide performance and the progress toward
23 meeting long-term objectives and interim goals and interim targets; and (3) the capture and
24 assessment of additional information that may be subsequently identified as relevant to
25 system-wide responses, including new model results. General guidance for the process of
26 conducting assessments follows in this Guidance Memorandum.

27
28 The strategy developed for assessing measurable changes in system responses is a multi-step
29 process consisting of monitoring design analysis, data acquisition, data analysis,
30 interpretation, integration, and assessment of system-wide performance. This strategy is
31 designed to address, but is not limited to, the following types of questions: (1) has the
32 indicator changed from the pre-CERP condition; (2) is the change in the desired direction and
33 magnitude; and (3) is the change consistent with expected responses described in the Plan's
34 hypotheses as identified in section 3 of the MAP, Part 1. This Guidance Memorandum also
35 addresses the strategy for determining if the measured responses are achieving the interim
36 goals and interim targets established according to section 385.38 of the Programmatic
37 Regulations.

38
39 A key part of this strategy is determining pre-CERP variability and establishing reference
40 conditions for each of the hydrologic, water quality, and ecological indicators. Background
41 variability and spatial patterns will be the emphasis of this effort for the first five years before
42 the implementation of specific Plan projects that are expected to influence the ecosystem. A
43 fundamental concept underlying the assessment strategy is the ability to detect measurable
44 change of individual and aggregated performance measures. Measurable change is defined as
45 the magnitude and direction of change of a performance measure from the pre-CERP
46 reference condition (i.e., environmental baseline).

1
2 Another approach for analyzing trends in ecological systems is to study the changes in the
3 response of ecological attributes along a known stressor gradient (e.g., hydrologic, water
4 quality). This approach may be particularly suited for cases where the temporal extent of a
5 database is not sufficient to detect statistically significant trends and changes beyond the
6 limits of background variability. This methodology, which would incorporate sampling along
7 environmental stressor gradients, can be used to supplement other approaches to evaluate
8 CERP induced changes.
9

10 Critical to the success of implementing any assessment is the ability of the sampling designs
11 for the RECOVER MAP, Part I monitoring components to have the power to detect
12 measurable change in hydrologic (including water supply and flood protection), water
13 quality, and ecosystem indicators. The organization of the MAP attempts to reflect the
14 stepwise scientific process required to detect and measure variability, status and trends in
15 individual performance measures by Principal Investigators. This process is followed by the
16 integration of multiple performance measures at the module level. Finally, some combination
17 of integrating performance across modules and assessment of system-wide hypotheses from
18 the Total System Model will be used to provide a system-wide assessment of hypotheses.
19

20 **6.5.1 Integrative Assessment Strategy and Process**

21
22 A multi-step process for detecting and assessing changes in performance measures called the
23 Integrative Assessment Guidance (IAG) process, has been established for assessing progress
24 toward achieving interim goals and interim targets, and evaluating the status of module and
25 system-wide hypotheses (Figure 6-3). The guidance is comprised of three sections. The first
26 addresses assessments at the MAP component level (i.e. specific monitoring and supporting
27 research projects), the second at the module level, and the third at the system-wide level. The
28 assessment process, outlined in Figure 6-2, applies specifically to the natural system and will
29 be modified, as necessary, to address water supply and flood protection.
30

31 **6.5.2 MAP Component-Level Module Level**

32
33 The MAP component-level guidance is directed at the Principal Investigators working on
34 specific monitoring and supporting research projects within a Module Group. The assessment
35 guidance at the MAP component-level has three parts: (1) estimating the ability to detect
36 change; (2) establishing reference conditions; and (3) measuring changes from reference
37 conditions. At this level, the assessments focus on: (1) selecting the analysis tools necessary
38 to measure the magnitude and direction of change in the performance measures; (2)
39 determining whether changes are consistent with desired trends or targets and MAP
40 hypotheses; and (3) determining if there are indications of unanticipated events that affect
41 desired outcomes (Figure 6-2).
42

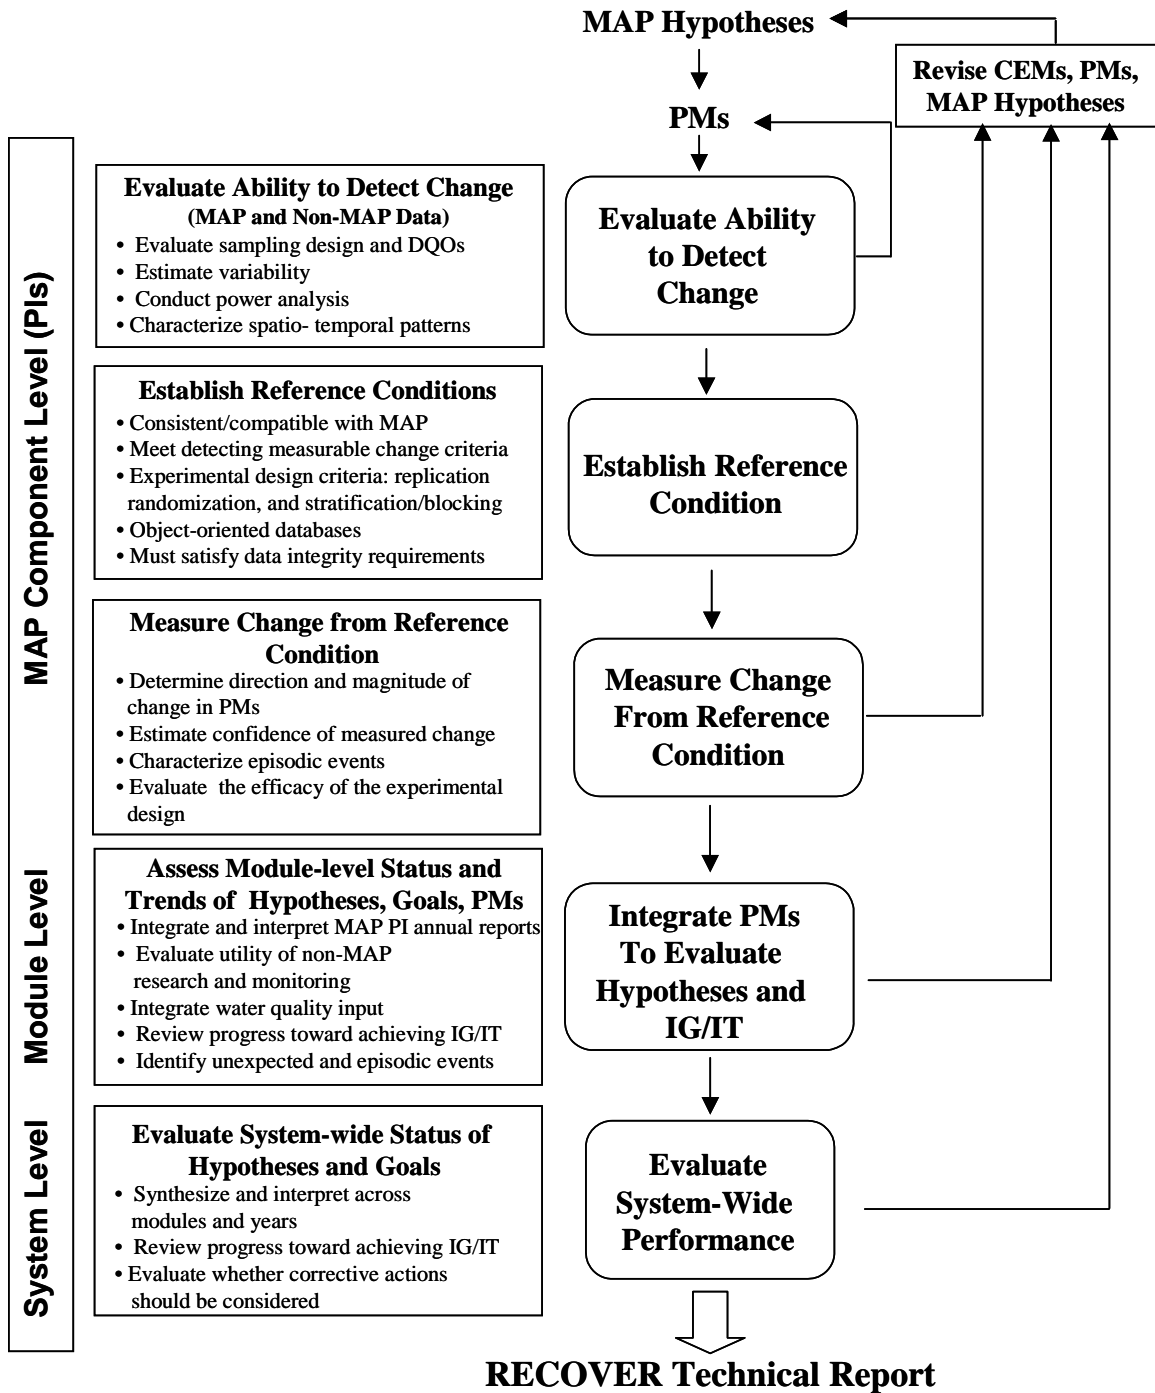

43 **6.5.3 Module Level**

44
45 Module-level analyses focus on the integration of multiple performance measures in the
46 assessment of specific hypotheses. These module-level analyses cumulate data for trend

1 analysis. At this level, Module Groups integrate and interpret the annual reports prepared by
2 each Principal Investigator, evaluate the relevance and utility of non-MAP data and consider
3 any other information relevant to the assessment. Module-level assessments are conducted to
4 determine the direction and magnitude of change in the integrated performance measures to
5 determine if the changes are consistent with expected responses described in causal
6 hypotheses. If the trends do not correspond to the expected responses, the Module Groups
7 must provide plausible scientific explanations (Figure 6-2). Finally, the Module Groups will
8 contribute interpretations of progress toward achieving interim goals and interim targets,
9 identify unexpected results, and address episodic events.

10 **6.5.4 System-Wide**

11 System-wide analysis performed by the RECOVER Assessment Team addresses the
12 synthesis of findings across modules and across years to provide a comprehensive description
13 of the status of the system. While the final approach to the system-wide level assessments
14 remains to be clarified, it is important for the integrative assessment process to allow for
15 flexibility and not be too prescriptive or too limiting in the approach at the system-wide level,
16 including consideration of the Total System Conceptual Model as an additional tool. This
17 assessment will include an evaluation of progress toward achieving system-wide interim
18 goals and interim targets. A summary assessment report is prepared in order to determine
19 whether system responses are consistent or inconsistent with the system-level restoration
20 goals and hypotheses. Assessments will also be conducted to determine whether corrective
21 actions might be necessary to improve performance.
22
23
24
25

MAP = Monitoring & Assessment Plan	DQO = Data Quality Objective	PI = Principal Investigator
CEM = Conceptual Ecological Model	IG/IT = Interim Goals and Interim Targets	PM = Performance Measure

1
2
3

Figure 6-2: MAP Technical Assessment Process

1 **6.5.5 Identification of Need for MAP Changes or Adaptive Management**
2 **Actions**
3

4 The results from the system-wide analysis may result in the need for the RECOVER
5 Assessment Team to address a suite of options. The intent of this section is to provide
6 guidance on the possible decision alternatives that could result from the assessment of
7 individual or multiple performance measures and MAP hypotheses within and across
8 modules. A fundamental assumption is that this guidance has been applied to analyzing and
9 integrating the performance measures within a module.

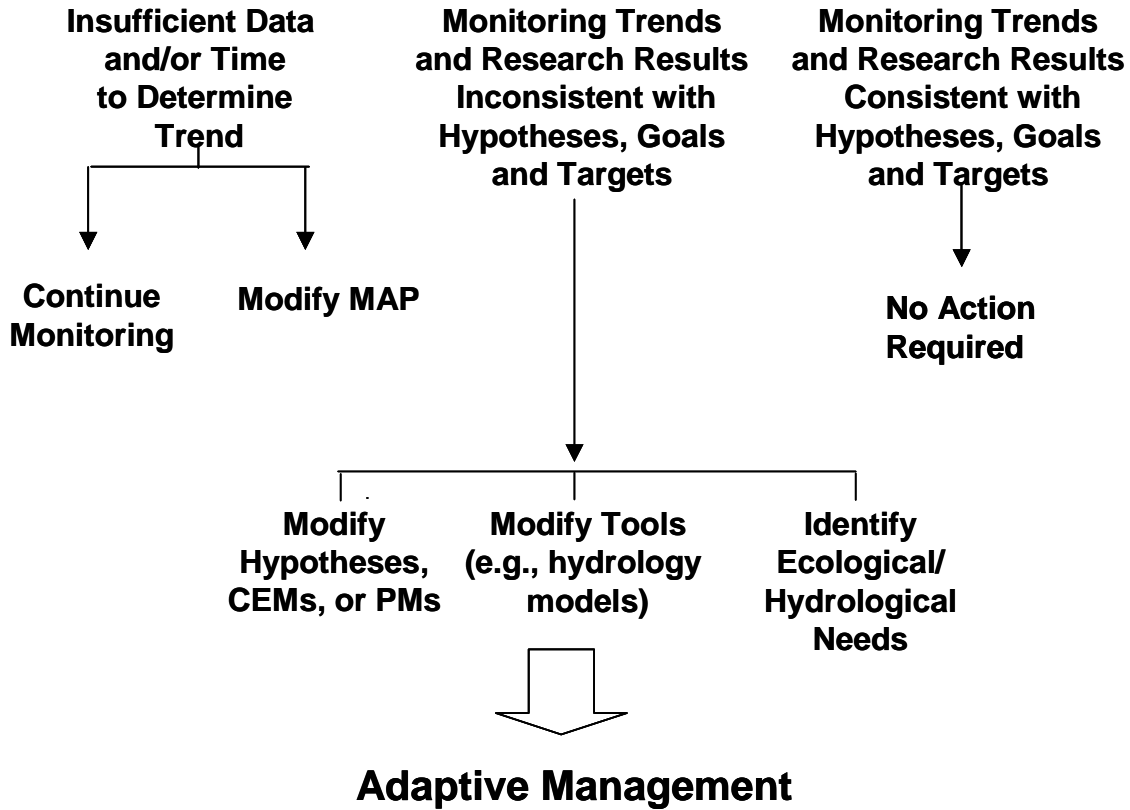

10
11 There are three plausible alternatives for how to interpret system-wide assessments as
12 illustrated in Figure 6-3. The first alternative recognizes that there was insufficient data or
13 time to determine a pattern or trend. In this case, two possible explanations can be postulated:
14 (1) insufficient time for either the performance measure or the system to respond in a manner
15 allowing for the MAP hypothesis to be critically examined; or (2) the wrong metrics are
16 being measured and reported. In the former case, the monitoring should continue until the
17 performance measure being assessed is able to express itself fully. In the latter case, the
18 option is to modify the MAP.

19
20 The second alternative is that the monitoring trends and research results are inconsistent with
21 and/or do not support the hypotheses or the interim goals and interim targets. This scenario
22 could result in the following options: (1) modify the hypotheses, conceptual ecological
23 models and/or the associated performance measures; (2) modify the tools (i.e., hydrologic
24 models); and/or (3) identify system-wide hydrological and/or ecological needs to improve
25 performance of the Plan. This last option would provide the basis for initiating the next phase
26 of the adaptive management process (see Figure 6-1) that would address alternatives for
27 modifying water management operations and/or the Plan.

28
29 In the third alternative, a trend is detected that is consistent with the hypotheses and the
30 interim goals and interim targets. No action would be needed in this case.

31
32 The RECOVER technical report (section 6.6.3) will use this framework in describing its
33 system-wide assessment and will base its conclusions based on the best available science.
34 These conclusions may include whether changes to the MAP are needed or if adaptive
35 management actions to improve Plan performance should be considered.
36
37

Synthesis and Interpretation Framework

CEM = Conceptual Ecological Model MAP = Monitoring and Assessment Plan PM = Performance Measure

1
2
3

Figure 6-3: Decision Framework for Interpreting System-Wide Assessments

1 **6.6 TECHNICAL ASSESSMENT REPORTING FRAMEWORK**

2 3 **6.6.1 Strategy and Purpose**

4
5 The Plan's Technical Assessment Reporting Framework (Figure 6-4) places considerable
6 emphasis on the analysis, synthesis and interpretation of the monitoring and research data.
7 Further, the new data that are acquired annually are combined with previous years' trend data
8 to provide a comprehensive and timely synthesis of all the available data. In so doing, this
9 framework assures the early identification of potentially unexpected results and an
10 assessment of the magnitude and direction of change in ecosystem responses, including
11 indicators of interim goals and interim targets and the basic information required to produce
12 the RECOVER Technical Report.

13
14 The Technical Assessment Reporting Framework (Figure 6-4) illustrates the process
15 proposed for analyzing, integrating, and interpreting the MAP and other monitoring and
16 research data in a comprehensive, systematic, and logical manner. Two principles underlie
17 this framework: (1) an emphasis on the importance of conducting annual assessments of the
18 monitoring data, and (2) the assumption that the technical foundation for the MAP resides
19 with the Principal Investigators and Module Groups. After having completed several
20 reporting cycles, the timeline will be evaluated based on its ability to: (1) assess the efficacy
21 of the sampling designs; (2) capture trends in system responses; (3) detect unexpected
22 responses; (4) assess progress toward achieving interim goals and interim targets; and (5)
23 determine whether corrective actions need to be considered.

24 25 **6.6.2 Reporting Framework**

26
27 The Technical Assessment Reporting Framework identifies the types of reports that
28 contribute to the RECOVER Technical Report. The Principal Investigator Report, prepared
29 by the Principal Investigators, is the first level of the MAP and non-MAP data analysis and
30 interpretation. The Principal Investigators Report will be required annually. This report will
31 cumulate new data annually and combine it with previous years' data to provide a "running"
32 status of the performance measures of interest at the MAP component and module level. Data
33 used in these reports must meet data quality objectives and adhere to Quality Assurance
34 Systems Requirements. In addition, databases used in the reports must comply with data
35 validation and standardization requirements for CERP.

36
37 Each of the Principal Investigator Reports for a module will contribute to the preparation of
38 the MAP Module Group and Assessment Team (AT) System Status reports. The objectives
39 of these reports are to integrate and interpret the information in each of the Principal
40 Investigator Reports, review non-MAP data for inclusion in the assessment and provide a
41 module-level (Module Group Report) and system-wide (AT System Status Report) status of
42 the hypotheses, restoration goals, and performance measures based on a multi-year analysis
43 of trends. These reports will also review progress toward achieving interim goals and interim
44 targets. Finally, the integration of all module data will afford the opportunity to identify
45 unexpected or episodic events.

64

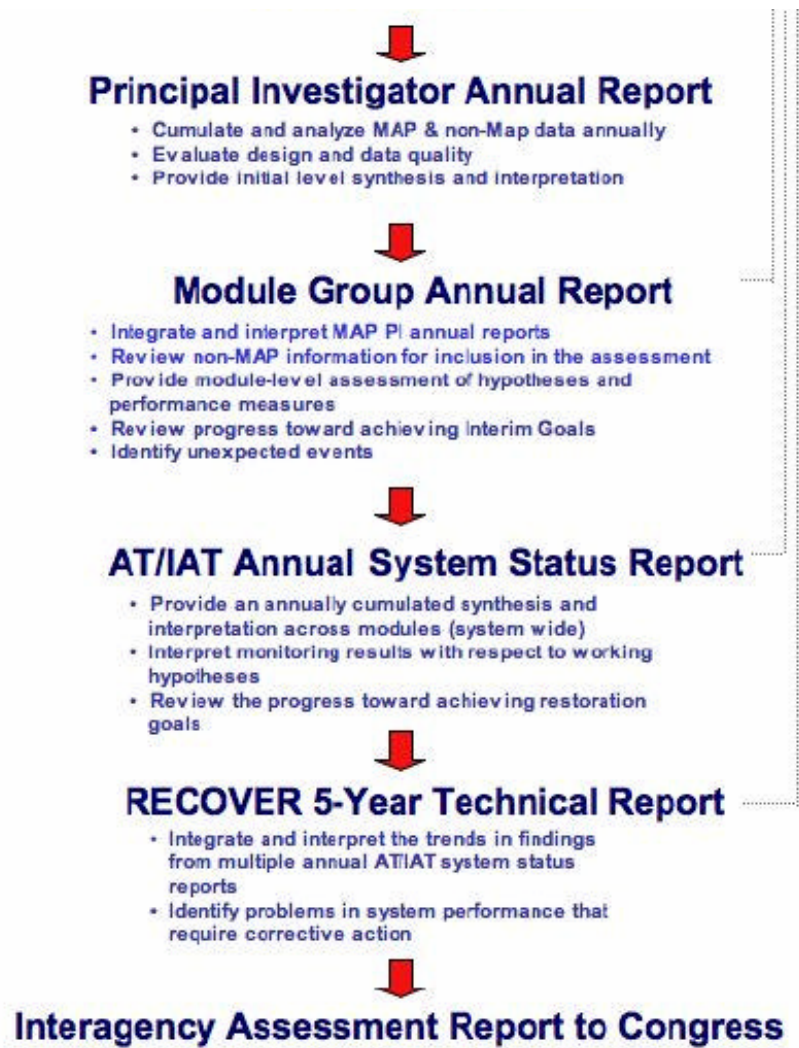

Figure 6-4: Assessment Reporting Framework

1 Each of the MAP-Principal Investigator Reports for a module will be used in the preparation
2 of the MAP Module Group Report. The objectives of the MAP Module Group Report are to
3 integrate and interpret the information in each of the Principal Investigator Reports, review
4 non-MAP data for inclusion in the assessment and provide a module-level status of the
5 hypotheses, restoration goals, and performance measures based on a multi-year analysis of
6 trends. This report will also review progress toward achieving module-level interim goals
7 and interim targets. Finally, the integration of all module data will afford the opportunity to
8 identify unexpected or episodic events.

9 10 **6.6.3 RECOVER Technical Report**

11
12 The RECOVER technical report will provide a system-wide integration of all current and
13 past hydrologic, water quality, and ecological data, synthesized across modules. The
14 RECOVER technical report provides an assessment of whether the goals and purposes of the
15 Plan are being achieved, assessing progress towards achieving system-wide interim goals and
16 interim targets, and provides an assessment of system-wide hypotheses. The report will
17 specifically identify those system responses that are inconsistent with the goals and purposes
18 of the Plan, and will evaluate whether corrective actions should be considered based on
19 scientific findings of system-wide or regional ecological needs. In accordance with
20 section 385.31(b)(4) of the Programmatic Regulations, the technical report will be prepared
21 at least every five years. However, preparation of RECOVER technical reports more frequent
22 than a five-year interval will occur as appropriate, in response to specific, system-wide
23 technical and scientific issues, the magnitude and frequency of undesirable or unexpected
24 responses, in response to new scientific understandings of the natural systems, and as
25 improved understanding of the rates of ecological responses may influence reporting rates.

26 27 **6.6.4 Integrative Assessment Reporting Timeline**

28
29 The reporting structure and timelines, outlined in Figure 6-5, provides guidance for the
30 production of annual reports by MAP Principal Investigators, Module Groups, and the
31 AT/Integrative Assessment Team (IAT). This guidance does not identify fixed reporting
32 dates because of variations in starting times for different MAP Principal Investigator
33 contracts. However, over time, it is anticipated that reporting timelines at the MAP Principal
34 Investigator Reports will become more synchronized. At such time, the reporting timelines
35 should follow the sequence specified for each block in Figure 6-5.

36
37 At the MAP Principal Investigator level, data will be collected and processed on an annual
38 basis. After each 12-month data collection/processing period, the Principal Investigators will
39 prepare an analysis and interpretation of each year's new data plus previous year's data
40 (MAP Principal Investigator Annual Report). This analysis should be complete within nine
41 months from the end of the 12-month data collection period. This analysis phase will include
42 incorporation of physical (e.g., hydrology and geomorphology) and chemical (e.g., water
43 quality and contaminants) data where appropriate. Encompassed within the nine-month
44 analysis period is a six-month time lag in availability of physical and chemical data because
45 of Quality Assurance/Quality Control and data management requirements. The time lags in
46 accessing some data sets do not allow the Principal Investigators to meet the reporting

1 milestones established in this guidance. In these cases, time lags must be shortened to no
2 more than six months in order to meet reporting milestones. Additionally, multi-agency
3 physical and chemical data have inherent issues such as consistent reporting mechanisms,
4 data formatting and data availability. These issues create constraints on incorporation of
5 physical and chemical data for the MAP analysis that must be resolved.
6

7 The individual MAP Principal Investigator Annual Reports, which will eventually include
8 several years of data that has been accumulated and analyzed annually, are then synthesized
9 at the Module Group level to address the Module hypotheses, relevant performance measures
10 and interim goals. The Module Group Annual Reports will include a compilation of the
11 individual Principal Investigator Annual Reports plus a synthesis section that synthesizes,
12 assesses, and interprets the status of the relevant Module hypotheses and interim goals. It is
13 envisioned that the annual analysis of hydrology and water quality status and trends will be
14 cumulative, integrating historical (pre-MAP) databases and the annually acquired MAP
15 databases and provide the interpretative context for assessing the status of Module level
16 hypotheses. Each year the Module Group Annual Reports will be summarized and
17 accumulated every year (i.e., rolled up) to create an Annual System Status Report that will
18 address the overall status of the system relative to system level hypotheses, performance
19 measures and restoration goals.
20

21 There are three functions for the Annual Assessment Team System Status Reports. First, at
22 least every two years, the current Annual System Status Report, which represents the
23 accumulation of multiple years of information, will be used to provide information to the
24 National Academy of Sciences and for the CERP Report Card. There are no new analyses
25 involved in this activity. Second, at least every five years, the current cumulated Assessment
26 Team Annual System Status Report, which represents multiple years of data “rolled up” into
27 one report, will be peer-reviewed. This peer review process will be completed before being
28 used as one of the major components of the RECOVER Technical Report which is mandated
29 by the Programmatic Regulations to provide an assessment of the Interim Goals. In addition,
30 this edition of the Annual System Status Report will provide the following: 1) a synthesis of
31 findings across modules and across years to provide a holistic description of the status of the
32 system; 2) an evaluation of the results in relationship to supporting system-level hypotheses
33 and achieving system-wide Interim Goals; 3) a summary of those changes that are consistent
34 with goals and hypotheses and those that are not; 4) a discussion of why the goals and
35 hypotheses are not being achieved; and 5) an identification of those issues relevant to
36 adaptive management.
37

38 The third use of the Annual Assessment Team System Status Report is to identify and report
39 major unanticipated findings that may need attention and correction that have been identified
40 and “flagged” by the Module Group Annual Reports. The module groups would include, as
41 appropriate, these “red flags” as the module groups synthesize the Principal Investigator
42 Reports and prepare the Module Group Annual Reports. If an unexpected and undesirable
43 response, with respect to the goals of CERP or the hypotheses, is detected at the module or
44 system scale, a technical report can be generated immediately.
45

1 **6.7.1 Principal Investigator Level**

2
3 This level of external peer review would primarily consist of that associated with drafted
4 journal articles that relate to completed studies and other research associated with Plan
5 activities. As appropriate, these activities will be identified in individual scopes of work for
6 individual MAP components.
7

8 **6.7.2 Module Group (Module Group Report) and System Level (AT System**
9 **Status Report)**

10
11 External peer review should occur on a case-by-case basis as deemed appropriate by the
12 RECOVER Assessment Team. These may include situations such as when the assessment
13 indicates that: (1) changes in the MAP components (e.g. conceptual ecological models,
14 performance measures or MAP hypotheses) are warranted; (2) there are unresolved and
15 significant technical disputes; or (3) there are significant new findings that are relevant to
16 ecosystem responses.
17

18 **6.7.3 RECOVER Technical Report Level**

19
20 The RECOVER Technical Report will contain scientific information and interpretations and
21 will potentially present scientifically and technically controversial issues and findings. The
22 process leading to the report involves a large, long-term investment and multiple projects.
23 Therefore, peer review at this level should be consistent with peer review guidance (currently
24 CERP Guidance Memorandum 27.00).
25

26 Once completed, the comments, feedback and other information (constructive criticism and
27 scientific and technical advice) resulting from peer review must be adequately considered
28 and documented. This information should be included as an attachment or appendix to the
29 final version of the report. The report should also include a section addressing how the peer
30 review comments were incorporated, including an explanation and rationale for not
31 incorporating specific suggested changes if this is the case, as well as making any
32 recommendations for inclusion or consideration in following report iterations. The peer
33 reviewers should be included in the distribution list for the report to allow the reviewers to
34 see how their comments or input were addressed.

ATTACHMENT 6-A MINIMUM REPORTING GUIDANCE

The following is minimum reporting guidance for Principal Investigators, Module Groups, and the RECOVER Assessment Team that parallels the assessment process discussed in this Guidance Memorandum and Figure 6-3 of this Guidance Memorandum. This minimum reporting guidance applies specifically to the natural system and can be modified, as necessary, to address water supply and flood protection.

A. Evaluate Ability To Detect Change–Principal Investigator Level

- Describe and discuss the results of the power analysis for the sampling design.
- Determine the minimum detectable difference of the power analysis and associated confidence and uncertainty.
- Describe any suggested changes in the MAP sampling design and implications of those changes for the power analysis and the minimum detectable difference.

B. Establish Reference Condition–Principal Investigator Level

- Describe non-MAP monitoring and research data sources used in the assessment. If non-MAP data were used, did the data meet the criteria outlined in this guidance? If non-MAP data were used and did not meet the guidance criteria, provide a rationale to justify the inclusion of the data.
- Describe how representative the data are in space and time.
- Describe the approaches used to address measuring variability.
- Enter the data into a system-wide data management system.

C. Measure Change From Reference Condition–Principal Investigator Level

- Describe the methods used to estimate the direction and magnitude of change in performance measures from the reference state both annually and cumulatively for multiple years.
- Compare current status of the performance measure with the performance measure's desired trend or target.
- Evaluate consistency of monitoring results with the MAP hypotheses.
- Determine if there are indications of unanticipated events and describe how the events may be affecting the desired outcome.
- External peer review will be conducted as appropriate.

D. Integrate Performance Measures To Evaluate Module Hypotheses-Module Group Level

- Integrate multiple performance measures to provide an assessment of module-level hypotheses.
- Describe the direction and magnitude of change in the integrated performance measures and determine if the changes are consistent with expected responses described in the Plan's hypotheses.

- 1 • If trends do not correspond to expected responses, provide a probable rationale or
- 2 explanation for the findings.
- 3 • Evaluate progress toward achieving module-level interim goals and interim targets.
- 4

5 **E. System-Wide Performance Evaluation–Recover Assessment Technical Team Level**

- 6 • Synthesize findings across modules and across years to provide a holistic description
- 7 of the status of the system.
- 8 • Evaluate the results in relationship to supporting system-level hypotheses and
- 9 achieving system-wide interim goals and interim targets.
- 10 • Summarize those changes that are consistent with the interim goals and interim
- 11 targets and hypotheses and those that are not.
- 12 • Provide a discussion of why the interim goals and interim targets and hypotheses are
- 13 not being achieved.
- 14 • Provide a discussion of adaptive management issues.
- 15 • The system-wide Technical Report will be peer reviewed, consistent with the
- 16 Programmatic Regulations and the appropriate CERP guidance on peer review.
- 17
- 18

APPENDIX A DEFINITIONS

In addition to those terms already defined in the Programmatic Regulations, the following terms are defined for these Guidance Memoranda:

Acceler8 means the program of the State of Florida to implement certain features of the Plan using State resources and financing.

Alternative Formulation Briefing (AFB) means the meeting held to discuss the results of the formulation and evaluation process and to obtain approval of the tentatively selected plan, as described in USACE regulations and policy.

Assessment Report means the report prepared by the USACE and the SFWMD, in consultation with Federal, Tribal, State, and local agencies and tribal governments, as part of the adaptive management program, in accordance with the Programmatic Regulations.

Assessment Team means the RECOVER team that is responsible for conducting assessment activities under the adaptive management program.

Comparable source means a source that is sufficiently similar to or equivalent to the existing legal source in terms of quantity and quality.

Design Coordination Team (DCT) means the team established pursuant to the design agreement between the Corps of Engineers and the non-Federal sponsor.

Elimination or transfer means the reduction of all or a portion of an existing legal source of water caused by implementation of one or more CERP projects and/or the sending of all or a significant portion of an existing legal source of water from its original location to another location within the South Florida ecosystem caused by implementation of one or more CERP projects.

Existing Conditions Baseline means the hydrologic conditions in the South Florida ecosystem as modeled by using a multi-year period of record based on assumptions such as land use, population, existing legal uses of water quality and assumed operations of the C&SF Project that includes authorized CERP projects with approved operating plans and non-CERP activities with approved operating plans at the time the tentatively selected plan is identified.

Existing legal use means a water use that is authorized under a SFWMD or FDEP consumptive use permit under Part II of Chapter 373, F.S., or is existing and exempt from consumptive use permit requirements under Chapter 373, F.S., such as domestic uses of water.

1 **Existing legal source** means the quantity and quality of water available within a water basin
2 (including seepage, surface water, direct rainfall, and groundwater) used for a water supply,
3 which is legally protected by Federal or State law, including the quantity and quality
4 necessary for protection of the source of supply, consistent with State and Federal law, as of
5 December 11, 2000, for:

- 6 (i) An agricultural or urban water supply;
- 7 (ii) Allocation or entitlement to the Seminole Indian Tribe of Florida under
8 Section 7 of the Seminole Indian Land Claims Settlement Act of 1987
9 (25 U.S.C. 1772e);
- 10 (iii) the Miccosukee Tribe of Florida;
- 11 (iv) water supply for Everglades National Park; or
- 12 (v) water supply for fish and wildlife.”

13
14 **Future Without CERP Baseline** means the hydrologic conditions in the South Florida
15 ecosystem as modeled by using a multi- year period of record based on assumptions such as
16 land use, population, water demand, water quality, and assumed operations of the C&SF
17 Project that includes projected conditions at the end of the period of analysis for the Plan and
18 specifically excludes any CERP projects.

19
20 **Indicator** means an element or component of the natural or human system that is expected to
21 be influenced by the Plan, and has been selected to be monitored as representative of a class
22 of system responses.

23
24 **Initial Operating Regime** means the hydrologic conditions in the South Florida ecosystem
25 at the time that a CERP project becomes operational as modeled by using a multi-year period
26 of record based on assumptions such as land use, population, water demand, and water
27 quality and assumed operations of the C&SF Project that includes authorized CERP projects
28 with approved operating plans and non-CERP activities with approved operating plans at the
29 time that the tentatively selected plan is identified.

30
31 **Intervening Non-CERP activities** means changes in permitted demands and structural or
32 operational changes to the C&SF Project or other water resources systems in the South
33 Florida ecosystem that are made by Federal, State, tribal, and local governments and which
34 not included in the Plan.

35
36 **Monitoring and Assessment Plan (MAP)** means the plan prepared by RECOVER that
37 describes the system-wide monitoring program to be implemented by RECOVER that is
38 designed to measure status and trends towards achieving the goals and purposes of the Plan
39 and the activities that assess if measured responses are desirable and are achieving the
40 interim goals and interim targets or the expected performance level of the Plan.

41
42 **MAP Module Group Report** means the report prepared by RECOVER that integrates and
43 interprets the information in each of the Principal Investigator reports, reviews non-MAP
44 data for inclusion in the assessment report and provides a module-level status of the
45 hypotheses, restoration goals, and performance measures based on a multi-year analysis of

1 trends. The MAP Module Group Report also reviews progress at a module-level towards
2 achieving the interim goals and interim targets.

3
4 **Next-Added Increment Baseline** means the hydrologic conditions in the South Florida
5 ecosystem as modeled by using a multi- year period of record based on assumptions such as
6 land use, population, water demand, water quality and assumed operations of the C&SF
7 Project that includes projected conditions at the end of the period of analysis for the Plan and
8 includes only those approved CERP projects at the time that the tentatively selected plan is
9 identified.

10
11 **Other water-related needs** means Federally authorized purposes of the Central and
12 Southern Florida Projects, including water supply, saltwater intrusion prevention; water
13 quality protection, protection of wetland systems within urban areas, navigation, and
14 recreation.

15
16 **Principal Investigator Annual Report** means the report prepared annually by Principal
17 Investigators conducting MAP monitoring activities that presents the first level of data
18 analysis and interpretation for a specific MAP component (and relevant additional
19 information). As part of this report, the Principal Investigator will estimate the ability to
20 detect change, establish reference conditions, and measure change from reference condition.

21
22 **Quality Review Board (ORB)** means the periodic meetings chaired by the Jacksonville
23 District Commander and the Executive Director of the South Florida Water Management
24 District to discuss the status of the CERP program.

25
26 **RECOVER System Status Report** means that report prepared by RECOVER that provides
27 a synthesis of findings across MAP modules and across years to provide a comprehensive
28 description of the status of the system. This report will include an evaluation of progress
29 toward achieving system-wide interim goals and interim targets to determine whether system
30 responses are consistent or inconsistent with the system-level restoration goals and
31 hypotheses.

32
33 **Reference Condition** means the hydrological, water quality, and/or ecological state of the
34 system or a specific indicator, which encompasses spatial and temporal background
35 variability, prior to implementation of a CERP project that may be modified by the condition.

36
37 **Selected alternative plan** means the plan selected by the USACE and the non-Federal
38 sponsor for further design and presentation to the public as the result of completing technical
39 analyses of the no-action alternative and other alternative plans formulated and evaluated for
40 a PIR.

41
42 **South Florida Water Management Model (SFWMM)** means the regional hydrologic
43 model developed by the SFWMD that is used to simulate hydrologic conditions in the South
44 Florida ecosystem using a multi-year period of record.

1 **Stage-duration curve** means the curve that plots the estimate of the elevation that water
2 reaches in a specific area or region as a function of the amount of time that that elevation is
3 equaled or exceeded. The curve describes, in a graphical form, the water elevation that may
4 be expected based on a range of hydrologic conditions as a result of a set of assumed
5 conditions, projects, and operations.

6
7 **Target** means a measure of change by an indicator that is expected or desired as the result of
8 implementation of the Plan.

9
10 **Technical Report** means the report prepared by RECOVER as part of the adaptive
11 management program and provided to the USACE and the SFWMD for use in preparing the
12 assessment report as required by the Programmatic Regulations. The technical report presents
13 RECOVER's assessment of whether the goals and purposes of the Plan are being achieved,
14 including whether the interim goals and interim targets are being achieved or are likely to be
15 achieved.

16
17 **Tentatively selected plan (TSP)** means the plan selected by the District Engineer and the
18 non-Federal sponsor for further design, pending approval of the plan at the AFB meeting
19 held in accordance with USACE regulations and policies.

20
21 **Volume-probability or flow-probability curve** means the curve that plots the estimate of
22 quantities of water produced in one or more water basins (usually expressed as acre-feet or
23 million/billion gallons) as a function of the percentage of time the quantity is equaled or
24 exceeded. The curve describes, in a graphical form, the water quantities that may be expected
25 in one or more water basins for a range of hydrologic conditions as a result of a set of
26 assumed conditions, projects, and operations.

27
28 **Water control plan** means the document that includes coordinated regulation schedules for
29 project/system regulation and such additional provisions as may be required to collect,
30 analyze and disseminate basic data, prepare detailed operating instructions, assure project
31 safety and carry out regulation of projects in an appropriate manner.

32
33 **Water basins** means the major hydrologic regions that comprise the South Florida
34 ecosystem.

35
36 **Water shortage** means the situation when insufficient water is available to meet the present
37 and anticipated needs of the users, or when conditions are such as to require temporary
38 reduction in total use within a particular area to protect water resources from serious harm. A
39 water shortage typically occurs due to drought conditions.
